1. Re: I/O via the Joystick Ports on the 400/800

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-01 01:41:13 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1992Jan1.014113.25543@usenet.ins.cwru.edu>
Source record: 113249

There IS a GUI for the 8-bit Atari: Diamond GOS, by Reevesoft.

It comes on a 64K bank-select supercartridge, though there's also a
disk-based version.

(Physically, the cartridge is suspicously IDENTICAL to the SpartaDOS X cart.)

It works with a variety of input devices, including the Atari ST mouse.

I just got it, and I think it's great, even though I don't have it
running under SpartaDOS X very well yet. (Can anyone help me there?)

2. HELP!!! I need an ATARI 800 keyboard... PLEASE!

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-01 21:31:12 UTC
From: jdz1@Ra.MsState.Edu
Message-ID: <1992Jan1.213112.25258@ra.msstate.edu>
Source record: 113250
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sources.wanted,misc.wanted,misc.forsale.wanted

Hi friends,
I _REALLY_ need your help!!! One of my mothers TEN cat
has managed to render my Atari 800 in-operable. Some of my
keys don't work correctly on my poor, poor machine. As you
know it's almost impossible to communicate with a computer
without a fully working keyboard 8-(. The deal is that the
cat pissed on the computer and I belive it has success fully
ruined the keyboard. It might be too much corrosion in the
keyboard section of the main board.
Well, I am hoping that someone out there has pieces and
parts of one of these machines out there and they just want
to get rid of it. Of course I'll pay shipping and a little
more if you really need it! I'm also looking for schematics
on this Atari. Maybe someone out there has an Atari 8-bit
packed away somewhere like the attic, and they wouldn't miss
it! I belive you get the general Idea, so I'll close with
that thought. PLEASE E-Mail me _ANY_ responses!!!

3. Atari on Amiga?

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-01 23:25:17 UTC
From: u1795@JSP.UMontreal.CA
Message-ID: <1992Jan1.232517.3985@jsp.umontreal.ca>
Source record: 113251
Cross-posted to: comp.misc.amiga.misc,comp.sys.atari.8bit

I have an atari 130XE in my closet and I'm feeling bad for not using it.

Is it possible for my Amiga 3000 to emulate an atari 8-bits?

BTW: I'm still stucked with old bad DOS 3.0 on my atari!!

PS: If there exist a way of some sort(?) that can convert old atari infocom games to amiga, that would be just as nice! But I guess that I'm not being realistic, am I?

u1795@jsp.umontreal.ca

4. Hayes 2400 baud modem direct to SIO port

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-02 14:16:13 UTC
From: jss@swrinde.nde.swri.edu
Message-ID: <7125@swrinde.nde.swri.edu>
Source record: 113252

Is it possible to connect a Hayes 2400 baud modem directly to the SIO port, similar to the way the SX212 is connected? If it is possible, could someone please post the connection diagram for the cable to go from the modem's 25 pin D connector to the SIO port? Also, what driver is available to use such a setup with Kermit65? Thanks for any help.

5. HELP: What's the best DOS?

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-02 15:32:18 UTC
From: dalessio@rtsg.mot.com
Message-ID: <dalessio.694366338@feldspar22>
Source record: 113254

I just got back my original 800 and a new XE Game System. I want to get back to the 8-bit world, and after using the ST at home and Suns at work, I find the 8-bit dos rather awkward. What would you say is the best dos to use, in terms of usefullness (i.e. not necessarily ease of use). If this has been discussed to death already, please email me directly. Thanks.

6. Re: Epson Laser Printer

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-02 20:34:36 UTC
From: bill@mwca.UUCP
Message-ID: <1947@mwca.UUCP>
Source record: 113155

In article <9112271651.AA24416@smithkline.com> poehland%phvax.dnet@SMITHKLINE.COM writes:
~>Epson is advertising a new bottom-of-the-line laser (below the EPL 7000) called
~>the "Action" laser. Presumably Centronics-compatible, etc. Sells on the street
~>for ca. $600, tho I belive list price is $895 or so.

~>Anyway, I was wndering, has anyone out there ever tried hooking up ANY kind of
~>laser directly to an 8-bit? I mean like, if you were already using an Epson
~>24-pin printer successfully with your 8bit (say, an LQ-500), if you just
~>substituted this laser for the dot-matrix would it work OK?

Should work fine, though some software may need adjusting. For instance, a
laser printer typically needs an explicity form feed to tell it when to print
a page if it didn't receive enough lines to fill it, whereas with a dot matrix
you see the partial page and advance it the rest of the way manually.
Other than software considerations, your 8-bit won't know the difference as to
what's on the other end.

~>I think next year the price will go even lower. <drool, drool>

Someone out here in the Bay Area has been advertising a 4 PPM laser printer
for $495! Don't recall the brand...

From: news@bbn.com
Message-ID: <68062@bbn.BBN.COM>
Source record: 113253

In article <1991Dec31.161357.15560@cpqhou.uucp> matthewr@cpqhou.UUCP (Matthew Rajmaniak) writes:
>Has anyone attempted to interface a PC style mouse to an Atari Joystick
>port? Would anyone have a serial handler that might be useful?

I interfaced the Commie mouse to the Atari. It was the cheapest available at the time, $40. I wrote a few stupid picture drawing programs using it. I never did anything more useful that that, though.

BTW the driver also works with a joystick. The driver runs off a timer interrupt, and maintains XY coordinates in memory, which can be read from any language, including BASIC PEEKs. Another version does the same thing with the Atari trakball. I think the trakball one is in the umich archive. -Stan

8. Looking for Voice Synth

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-03 01:56:04 UTC
From: sean%asylum.utah.edu@cs.utah.edu
Message-ID: <1992Jan2.185604.26747@hellgate.utah.edu>
Source record: 113156

I'm hoping to buy one of those old Alien Group Voice Synthesizers for the Atari 800 (I'm running a 65XE). Does anybody out there have a spare?

Also looking for a good modem....

-S.

> cable to go from the modem's 25 pin D connector to the SIO port?
> Also, what driver is available to use such a setup with Kermit65?
> Thanks for any help.

Yes, I have been using packard bell 2400 direct connect for a couple of years.
The cable I have came from Supra Coporation, (I think it was called an R-verter)
On one end is the atari SIO & on the other end is the rs-232 type plug.

I've used all most every driver made for the sx-212 succesfully. If you
want to use k65 let me know. Most drivers aren't compatible with it, but I am
using it now, by loading a compatible driver, and the k65nr (with sparta
dos 3.2). If you get the modem set up let me know, and I'll see if I can send
you the files uudecoded.

13. New Year's 8-Bit Movie Trivia Quiz

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-03 17:18:41 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201031718.AA01053@smithkline.com>
Source record: 113160

From: PHVAX::POEHLAND 3-JAN-1992 12:16:47.59
To: INET::"com-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: New Year's 8Bit Movie Trivia Quiz

Here's a little nostalgia quiz for you old-timers. Back in the early-to-
mid eighties several popular movies featured Atari 8-bit systems or software.
I'll give clues for 3 movies. Can anyone name all three?

1.) An Air Traffic Controller is intensely studying his radarscope. A closer
inspection reveals that instead of the tracks of in-flight aircraft, the
scope display is actually running Atari "Basketball".

2.) A little kid boots up an 800XL system (complete w/1050 disk drive) &
becomes an instant expert at "Pole Position". The kid is actually half
human/half robot.

3.) A gorgeous little mama, who also happens to be an computer genius &
electronics wiz, uses an Atari 810 drive in a car hooked up to a oscillo-
scope to uncover spies who later jam the Federal Reserve computers in
Culpeper, Virginia to precipitate a worldwide financial disaster.

These are the only 3 I can think of off the top of my head. Anyone know others?

14. Two Programming Challenges for the 8-Bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-03 17:40:16 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201031740.AA01083@smithkline.com>
Source record: 113161

I have two ideas for useful utilitiesI'd like to throw out for the temptation of you programmer-type dudes. The first is for AtariWriter-80/SpartaDOS, the second is for BobTerm/KERMIT 3.7.
In the Nov. '91 issue of Current Notes there appeared a review by Charles Cole of a nifty little patch that made AtariWriter+ compatible w/SpartaDOS 3.2 (disk-based Sparta). Known in popular parlance as "The LVAUG Patch". Among other things, this patch enabled you to leave AW+, go to DOS, & return again, plus it let you examine the directories of all drives (D1:-D8:) instead of just drives 1 & 2. Now, AtariWriter-80 is already Sparta-compatible (I've been using it w/Sparta 3.2 for over 2 years), but it's annoying not to be able to exit to DOS or view the directories of other drives. C'mon, peoples, who wants to do it? Write "The AT80 Patch", be a hero, & make a little money for yourself. (LVAUG sells their patch for $5; I think an AT80 patch should easily fetch $10 shareware fee; sell 500 of them & pocket the change.)
Regarding my second idea, I don't think anyone will argue against me if I offer the opinion that among telecom programs BobTerm has to be the best. There are others that are good, to be sure, but put it to a vote & BT will take all the prizes. There is, however, one thing missing from BT that causes it to fall just short of being the perfect universal 8bit telecom utility. All of us here on INET know what it is: BT lacks KERMIT xfer protocol. John Dunning did an excellent job with K65V3.7; his implementation of KERMIT is the nicest I've used. But gee, wouldn't it be nice if Dunning's KERMIT could somehow be grafted onto BobTerm? Maybe as an external "module" that the user could configure to autoload along with the main prog? So, who wants to try it? C'mon, you guys, these XL/XE machines can do SO much (especially when they're souped up w/extra memory & such), you KNOW most of the time we are only using them at a fraction of their capability.
It's high time for some really tough-ass programmers to crack the whip on these machines, show them who is Boss, make those lazy LSI chips really sweat! As Bob Puff's ads say, make your 8bit a real workhorse!
[BTW, last year I hit up on Bob about adding KERMIT to BT. He said he was too busy (an excuse I readily accept!) & also that weren't enough people on INTERNET/VAX systems to make the effort worthwhile. Hrrumph!! Sure would be neat if some budding INTERNET genius could show Bob he's wrong about that!]

Thats easy Chris, Ive been stockpiling equipment here for 2 years..
Ive asked around for stuff, gotten equipment from people whove
upgraded..etc.etc..
I could write ya a long list of whats sitting in the closet unused, but
I think Im set up here with enough atari stuff to last at least 20 years.
Theres 5 cpus, an extra mio, 7 drives...4 modems, 4 printers..etc.
The only thing Id probably wish for is replacement parts.. But im
sure that BEST will not run out for quite some time, and then theres
always the local atari hackers to turn to...
Ill be with ya on an 8 bit into the 2000's at least!

17. ATARI 130XE SYSTEM FOR SALE OR DONATION

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-03 23:30:03 UTC
From: stever@wjvax.UUCP
Message-ID: <2512@wjvax.UUCP>
Source record: 113165
Cross-posted to: misc.forsale,comp.sys.atari.8bit

ATARI 130XE SYSTEM FOR SALE OR DONATION

Consists of: Atari 130XE Computer (128K, ROM Basic)
Atari 1027 Printer (Letter Quality)
Atari 1030 Modem (300 Baud)
Atari 1050 Disk Drive (5 1/4")
Commodore 1741? Color Monitor
Various Software (All the usual stuff - games,
telecommunications, spreadsheets, word
processing, etc. - 20 or so disks)
Atari Cartridges (Defender, Asteroids,
Space Invaders)

All equipment in excellent shape, with all original packaging and documentation.
I would like to either sell it (for the best reasonable offer) or donate it to
a worthy charity. Any offers or suggestions will be entertained. The system is
located near Los Angeles currently.

If interested, please email to this account or call Steve
at (408) 438-4914 after 5 or leave message.

Message-ID: <1992Jan4.153942.15973@usenet.ins.cwru.edu>
Source record: 113166

I certainly agree on the first idea. I run AtariWriter 80 under SpartaDOS X, and I would also dearly like to be able to get back to DOS from AW80.

As for adding Kermit file trasfer to Bobterm - that would be nice, but the absence of Kermit is not why I don't use Bobterm. For me, VT100 emulation is far more important. There's no way to do full-screen editing online with Bobterm since it only does an incomplete VT52. So for me, the ultimate terminal program would either be a Kermit-65 that runs on the XEP80, or a VT850 that does Kermit file transfer.

------------------------------------------------------------
Results of Offical Atari 8-bit Voting Form so Far

Well, guys and gals, It looks pertty grim! Only around 27
people have answered this poll 8-(. I hope many people just
over looked this message. Anyway maybe it has something to do
with schools being out for Christmas break?

1. What machine are you currently using to access this
newsgroup? MARK only ONE.

7 Atari 8-bit
3 Atari ST
3 IBM PC/XT/AT/386/486
2 Amiga
2 MAC
4 Sun-Work Stations
7 Other

2. How do you use your 8-bit? MARK the closest response once

7 All the time for most of your computing needs
1 Programing
2 Hacking
5 Game Playing
3 Rarely
7 Collecting dust by disuse
5 Other:
1 Runs BBSs
2 WordProcessing
1 Home Finance
1 Email-Unix

3. Which Atari Systems to you have in working order? Mark all
that apply. {Got them all except 2}

8 Atari 400
12 Atari 800
13 Atari 800 XL
2 Atari 600 XL
1 Atari 1200XL
0 Atari 65 XE
11 Atari 130 XE
1 XEGS {Does this count? Game System}

4. How do you feel about an Electronic 8-bit Magazine? Mark
Only one.
```

20 For
5 Undecided/Don't care
1 Against Why?
1 Because it's Electronic
_ Other: _____

_____END of poll_____

Well, It looks like Our machines are either being
constantly used or collecting dust {pretty extreme}. Most are
of the 800 type. And we would like to see a 8-bit electronic
Magazine!
I'm going to continue this poll so that when the Students
get back to school they have a chance to vote! Thanks to all
that voted!!!! For the voting form see Message 2372 of this
newsgroup.

Later,
John Zitterkopf
jdz1@ra.msstate.edu

22. Atari 1200XL, drive, software for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-06 12:49:23 UTC
From: cpetterb@glacier.sim.es.com
Message-ID: <CPETTERB.92Jan6124923@mickey.glacier.sim.es.com>
Source record: 113170
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers

```
The following is for sale (everything works great):

Atari 1200XL (w/ original manual and box!)

Percom single density disk drive (w/ manual and cable)

Graphix AT printer interface

Basic XL (w/ manual)

Atari Basic

OS/A+ manual, DOS/XL manual

Syncalc (from Synapse, complete)

Home Accountant (from Continental, complete)

Family Finance (from Atari, complete)

Personal Finance (from Antic, complete)

Atari Proofreader dictionary disk (the other stuff is somewhere)

I'm selling it because I now have another computer that I use. I would
LIKE to get $100 plus shipping. I have been told by several sources that
this price is in line with the market. I would prefer to sell it as a
set, but if there are offers for parts that are reasonable, I may split
it up.

23. Complete ATARI Mega 2 ST System for $890 or best offer

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-06 17:57:16 UTC
From: jtang@einstein.oac.uci.edu
Message-ID: <2968987B.24290@orion.oac.uci.edu>
Source record: 113179
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,misc.forsale,misc.forsale.computers

For $850 you will get the following:
(I'll pay shipping UPS)

ATARI MEGA II ST:
Motorola 68000 cpu
2 Megabyte RAM on board (2048 KByte)
1 3.5 disk drive (additional port for second floppy drive)
MIDI ports built in
DMA port
1 serial port
1 parallel port
2 mouse/joystick port
realtime clock with battery back-up
keyboard/mouse/2 joysticks
blitter graphics chip
3 sound channels

ATARI Color Monitor (SM124)
Tweety Board installed (for stereo sound and connections to stereo
systems)
85 MEGABYTE SCSI external Harddrive
28ms seek time
ICD FAST DMA/SCSI ADAPTER Card
ST REPLAY4 Sound Digitizer
2400baud external modem

All original system software included.
All of my atari software (shareware, games, and utilities) included.
All manuals/cables included.

(basically, everything you will need to get the system up and running
in 10 minutes)

If you are interested please drop me a line and make an offer.

thanks,
Wayne

24. Answers to the 8-Bit Movie Trivia Quiz

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-06 22:18:59 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201062219.AA05276@smithkline.com>
Source record: 113171

Here are the answers to the 3 clues on the movie trivia quiz:

1.) The one where the radarscope displayed "Basketball" was AIRPLANE
(a spoof on all the "Airport" movies).

2.) The one that featured a half-robot kid who became an instant whiz at
"Pole Position" on the 800XL was D.A.R.R.Y.L. (I forget what the
acronym stood for, but it was the kid's name.)

3.) The one featuring a cute chick who used an 810 drive hooked up to an
oscilloscope in a car to detect hi-tech bank spies was PRIME RISK. The
general flavor of this movie was similar to "Wargames", except the male-
female roles were reversed, the girl was the hacker.

Most everyone got 1 & 2, nobody got 3. I knew 3 would be tough, the scene
showing the 810 drive probably only lasted 2 or 3 seconds.

Sorry, since no one got all 3, the Grand Prize will not be awarded.
(The Grand Prize was 10,000 shares of Atari Corp. stock, worth about $16.84
for the entire lot, if you can find someone to buy it. Too bad, looks like
I'll still be using the certificates to to ignite kindling in the fireplace,
it's cheaper than newspaper. <har-har>)

A couple folks coughed up the movies "National Lampoon's Vacation" &
"Cloak & Dagger" as additional examples of movies featuring Atari 8bits.

In January, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Picture Formats and Conversions for the ST.

Our 16-bit library currently has over 300 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
to attendees the January issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, Jan 8, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for details.

Hope to see you there,
Dani Roloson

29. START status update

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-07 09:02:11 UTC
From: 71450.1050@CompuServe.COM
Message-ID: <920107090210_71450.1050_EHB15-1@CompuServe.COM>
Source record: 113176

Please disregard my previous message regarding START magazine. After further investigation, the San Francisco District Attorney's office has told me that they are closing the cases that they have against Antic Publishing. It seems that the company is in the process of shutting down completely, and there are no funds left for reimbursement for subscribers. They also told me that the publisher is now an employee with PC Home Journal magazine, and that rumors of Antic being affiliated with this magazine were confused with this fact.

They said that consumers may take Antic to small claims court to try and recover funds due them, but the time and effort involved is probably not worth the small amount owed to them.

Sorry to have to spread bad news, but things don't look good.

-Lawrence Estep

I believe B&C ComputerVisions used to sell a ~$150 EPROM burner cartridge. It has been a long time since I've seen it advertised. It looked pretty neat. It was basically a cartridge with a zero insertion force socket on the top of it.

The December '85 issue of Antic (Vol 4, No 8) describes how to build an EPROM burner capable of burning 2716, 2732, and 2764 EPROMs. The parts were to cost a little more than $30 back in 1985. An assembler and debugger such as Atari's Assembler/Editor cartridge is required. (You could probably find something usable at atari.archive.umich.edu)

In case you decide to build it ... I seem to remember some minor corrections appearing in one of the following issues of Antic. I could check on that next time I go home if anyone is interested.

If you are looking for an EPROM burner for the 8-bit, Computer Software Services sells one. Actually, they have two versions: the standard burner, and a gang (2 at a time) burner.

If memory serves, the standard burner sells for $169, and the gang burner is $199.

A query for the 8-bit gurus out there:

A few years ago, I used to have this cool game for the 8-bit that came
from Germany. If I remember correctly, you were like a bird or a guy
on a bird, looking for the pieces of the King's crown. I believe
the king sat in a throne on the "far left" of the scrolling screen.
There was lightning (and I think water) to avoid. I also remember
something about eggs, but I may be mistaken.

Anyways, does anybody know the name of this game? I can't remember
what it was, and it's driving me crazy!

35. C compiler for 8-bit???

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-08 00:00:59 UTC
From: boltonja@sarah.cs.rose-hulman.edu
Message-ID: <1992Jan8.000059.24624@cs.rose-hulman.edu>
Source record: 113183

Hi folks. I am interested in finding a C compiler (preferably free) for ATARI 8-bit computers. If anyone has one, drop me a line at boltonja@cs.rose-hulman.edu

hmm... it seems someone has been playing with my name info--- Ralph the Wonder Llama? well, I'll fix that soon.

Also, does anyone have an atari which could make a coco running OS9 look BAD???

Jerry Bolton

I now own an Epson LQ570 after about two or three years of faithful service from a Panasonic dot matrix nine pin. Guess what? Daisy Dot III won't work properly on the Epson and it was great with the Panasonic. Some compatibility on that Epson! I'm not happy. It came with drivers for all sorts of MSDOS programs... USELESS!!!

Just something further to think about when considering upgrading to a more expensive printer.

I bought what was supposed to be a Rverter from a show about two years ago
and it never worked for me.. I took it apart and all connections were fine
in the cable and in the little PC board. It's really got me lost, and would
hate to see it go to waste. Perhaps a description of the official rverter
will tell me if mine is the real thing or something totally different although
I don't see how that's possible.

Are there ANY users of Diamond GOS out there? I want to hear from you!

I just puchased Diamond, and while the graphical desktop is neat, I have yet to succeed in getting ANY of the software I use to run under it.

Was I mistaken in assuming I could run such software as AtariWriter 80, VT850, and Kermit-65 from Diamond?

I run Diamond GOS on top of SpartaDOS X.

Anyone?

If anyone knows how to put up and "validate" user uploads on Oasis Jr,
please write me at Athena and let me know. Ill describe whats going on.
I set everything up, The message bases..everything!
I have (D) for a download area and (F) for a file area..
When I log in as a user, no matter what level I give it, I cant see
any of the files.. Hoever, when I log in as myself (sysop) I see every
single file on the system (EVEN THE BBS FILES) availiable to be downloaded!!
Supposedly this program only lets people download LOCKED files but I did no
lock the files that are part of the BBS!!..
Something is nutty here.
Any ideas what im doing wrong Greatly appreciated.

I have owned Diamond for quite a while now, and haven't upgraded to the new version 3 or whatever it is currently at. I quit at the previous version because EVERYTHING was crashing on my under SpartaDOS X. The Diamond Write didn't work at all for me, although Allan Reeve insists it works fine with his 130XE. I think that may be part of his problem though I doub t it, referring to the fact that he programmed all the memory drivers using a stock 130XE and only had documentation to look at when considering compatibilit y with the modified 800XL's and stuff out there. DIamond paint is okay, but that too bombs, especially when trying to use the magnifying glass.

I think those are the only Diamond applications, there were some pd small programs but nothing major. Oh, News Station was reprogrammed as a DIamond version but I never ordered that either. The GUI is pretty good, and although you are limited to about three windows open at any one time, (I think) they were not horribly slow when considering it was done on an 8 bit machine. I gave up on using it because it had couldn't really run standard programs. Oh sure they might run.. maybe, but you can just use plain old DOS to do that. The applications kept crashing, which is what turned me off. If the applications had been more solid it might have been more popular, also some additional programming support like something for 'Lightspeed C' or the Public Domain CC8 compilers would have been useful, as well as some sort of dialog box creator or something.

I dunno if this is what I'm talking about but, I'm wondering if it's possible
to connect a Hayes 2400 baud modem via the joystick ports?

All that would be needed is TTL->RS232 and vice versa which I believe
are already available on chips.

Message-ID: <92009.192516JJMCWILL@MTUS5.BITNET>
Source record: 113202

Externally the 600XL looks pretty much like the 800XL except that the case is smaller, and the keyboard seems less comfortable due to the fact that there is no room to rest your palms when typing. Also, it is missing a monitor jack, although that can be added. It also comes stock with 16K RAM but this can be upgraded to 64K either internally or with the plug in module that plugs into the Parallel BUS. ALso the 600XL uses 2 16Kx4 DRAMS instead of 8 64Kx1 DRAMS. This makes upgrading to anything beyond 64K a pain since you would need two 256Kx4 DRAMS, and nobody makes upgrade boards like this for the 600XL. I think Innovative COncepts does make a 128K upgrade for the 600XL which is "Completely 130XE compatible", probably meaning the Antic will see the extra memory just like the 130XE.

Yes, but if you did this, how could you use BOBTERM? Isnt it much easier to blow off the possible difficulties of doing this sort of work by just asking here on the net for someone selling a used PR connection?
Ive seen PR connections sell for $20-40 around here.. Not only would you get a perfect modem port for a modem which works with existing software, but you would also get a printer port too... You could also keep that joystick port free.. If you decide to add an xep80 later, it wont work if it cant go into a joystick port.. The ideal setup is always an interface.

Theres a few internal differences....
for one thing the 600xl has 16k I think.. I think it wasnt sold with 64k
like the 800xl was. The computer also does not have a monitor port, which
is a major problem for those who want to use XEP80's.. I know that theres
other differences, but thats what I know about. It also isnt able to be
rambo'd with ICD's memory expander.. I think my directions say that it will
only work with 1200xl's and 800xl's.. Thats another drawback.
I would say except for the following, its as good as an 800x.. It depends on
what you used it for.. For me, I would take a 600xl and rip it limb from
limb taking its keyboard and internal chips out to use as spare parts.. to
keep my 800xl going into the 2000's..

-Craigr@athena.mit.edu
(no responses or email sent to me at unixland.. they dont get here!)

> mid eighties several popular movies featured Atari 8-bit systems or software.
> I'll give clues for 3 movies. Can anyone name all three?
>
I can't name a one... Except maybe the robot one... I've seen a movie
with a kid/robot playing an Atari, and using his robot mind to control it
and win. The people in the story thought that he was human and adopted
him & stuff.

But HEY! The 2600 is still an 8-bit, so what about Cloak
& Dagger! The entire plot runs around a single 2600 game! (I liked the
scenes with the fat guy who ran a 2600 video game shop, and they had a
bunch of games playing in the background and stuff....) Ah the
good old years!!!

65. GUI's can be a waste!

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-10 19:23:42 UTC
From: apple.com!well!moon!cyberden!phbill
Message-ID: <8DmceB7w164w@cyberden.uucp>
Source record: 113118

Anyone notice what a waste of time and memory GUI's can be!? Even on the IBM! And Macs can be slow... So it's easy to use! I'd rather just have like a "preview" on a graphics screen for say a DTP, or howabout use big characters or something! Geeze! I have a demo. of GOE (supposedly better than Diamond), and it sucks (but hey, it's a demo.) If it ever works, I don't think I'll ever get used to the STish menu control (tocuh the bar and it comes up automatically...8-bits are too slow for that! I say CLICK them on! CLICK them OFF! Only WINDOWS for IBM works good! On the ST it WON'T GO AWAY! on the Mac you have to HOLD the button!!! I think I'll complain to them one day... (not crApple, but the guyz working on GOE..))

What was I writing this for? Oh yeah... I want to see more windows controlled stuff on just a plain 40col. screen! Sure the detail and stuff of mode8 is nice (diamond uses mode 15 (7+) correct??) But it's sooo slow!!!!!! Somebody out there has got to be smart! Make a nice GR0 mode windows "OS" or something!! Get the windows toolkit for Action! from AtariBase.. I've got it (just no action!.. I was interested mainly in what Action! looked like, and from seeing the listing, it looks ALOT like Pascal...)

Here's my 2nd request: Anyone have ACTION!??? And if so, how much would you sell it for?? Thanks! PhBiLl

Close, Stan. The jack is an RF modulator jack for a TV. You have to
do some circuitry addition inside the 600XL and install your own
connect to get NTSC type signals for a monitor. But I do believe
one of the XE machines has a single jack for monitor and another
for audio. Maybe it was the XEGS but that doesn't seem right as
you would think it would/should have a TV connector as it was
a "game Machine". Anyone with XE systems care to straighten me out
on this??

From: apple.com!well!moon!cyberden!phbill
Message-ID: <P2mceB9w164w@cyberden.uucp>
Source record: 113114

I want to see an OS a lot like Windows, but it doesn't HAVE to be a slow, memory eating GUI.. What I want to do is be able to work in something like BobTerm, then go to DOS, go back to BobTerm (I can already do that, but I'll probably be hung up on!), go maybe to AtariWriter+ (or something better), and back.. This is just an idea.. I know that at least one of these programs will conflict with another, so I want to see stuff written for a software OS... I want to have the WP and modem online at the same time, and switch between them... Maybe shrink the WP window a bit and see what the modem is receiving, use a joystick or mouse or F-key or console key, or ANYTHING, and switch directly back over to the term.program, and type some stuff.. It will maybe have like a command line that will change for each window open. If you are "in" the WP, if you go to file, it will just say stuff like "load", "save", "save as", "merge", etc., but if you have the terminal program activated, it will say "send", "receive", etc.etc..

What would you people think of it?? Would it be worth the trouble?? I want input! Maybe we can all petition Robert Puff to do it!! He's smart! He made BobTerm and a bunch of (un)Arcers and stuff!! Any suggestions!?

Thanks!

PhBill

I just acquired two Atari 800XLs (No power supplies)
an Indus GT drive for Atari (again no power or bus to connect it to computer)
Loads of disks though. A 1027 printer (No power and cable again)
As is obvious that I got this package for a dirt cheap price, Can anybody
tell me how to get the missing things for less than the price of the system.
Where to look for the cables. CAn I make them ? If yes how ???

Any help will be greatly appreciated.
No help is too little or too large :-)

Thanx in advance.
Mubashir

P.S : I'm very very interested in getting this thing to work.

Hmmm. power supplies. Okay, the 800XL has a DIN 7 connector for its
power supply, but it's only a 5volt DC power supply at about 1.5 amps or
so. Looking at the connector as it would come off the power supply:

```
+5v --- * * ---- GND
+5v --- * * ---- GND
NC- * * ---- GND
NC- *
```

Any decent +5v power supply could be used for this. I currently use a
power supply that also has +12v and -12V in case I ever get a Black BOX and
need those voltages. A 5 pin DIN connector from Radio Shack will fit, just
don't mistakenly plug it into the 800XL monitor jack, as that is a 5 pin DIN
connector.

The Indus GT disk drive uses the same power supply as the Atari 1050 and
XF551 disk drives and the Rana 1000 disk drive. It's a 9VAC 31Watt output
power supply. Part No. is C017945 on the one in my hand at this moment.
You may want to order one, as I've never fooled with those, perhaps
the Alchemist has some construction tips for these buggers?
This is the same power supply for the 400, 800, and 1200XL computers
as well. Best electronics has them for $15.00.

The 1027 power supply to my recollection was heavier duty. Best Electronics
has them for $30.00 part number CO61636.

The data cables going from the computer to the 1027 printer and the
disk drive are special SIO cables and only Atari used that kind of
connector so alas you may have to order those too. Best also has these
in 1 ft. , 3 ft. , and 6 ft. lengths for 8, 10, and 12 dollars respect-
ively.

Depending on what you are using as a display, don't forget to worry
about either a monitor cable or a RF cable and TV BOX. Good luck,
I hope this helps.

Best Electronics is at 2021 The Alameda, Suite 290
San Jose, CA 95126
408-243-6950

Yep! I made a mistake. What I was really trying to say was that Atariwriter 80, (one of just 2 major programs to support the XEP80) will not load in on a computer with less than 128k. This means that you couldnt use the xep80 to do word processing on a 64k 600xl... Only the 800xl would really be expandable (rambo upgrade) to become fully xe compatable and run this program. Bobterm would run ok and work on the xep80 and an upgraded 600xl.. but there too is the problem that it doesnt have a monitor jack and so you wouldnt be able to see the 40 column menus!!!! Youd have to make some kind of switch to do 40/80 column switching on 1 terminal...
All in all... The 600xl is very limited with the XEP80...
600xl's represent parts to me.. I see them advertised for $10..
paying $30-40 for an 800xl is well worth the extra money and features.
Another thing is that the 600xl would have no trouble with using an MIO on that bus port it has, but since the 600xl doesnt have a monitor port, it would have to use a TV set. A tv set with an MIO is very difficult as the MIO sends out quite a lot of interference. It wouldnt be good to own a 600xl if you want to use the MIO... (unless you build a monitor jack somehow...).. Just my opinion..
-Craig

Craig,

I think you seem to misunderstand the 600XL a bit. As it comes STOCK sure
it has all the problems you mention. But it can be easily upgraded to
have a monitor jack, 64K or 128K and even the 1200XL function keys!
I have one with the monitor jack, 64K and four FN keys mounted to the right
of the cart. port. It's the most compact XL/XE and I hope to upgrade it to
128K someday as it makes a better portable computer than the 800XL.

Jeff McWilliams

What you're looking for would be pretty extensive. As for doing WP and
then jumping back to Bobterm while online, I can already do that.
In fact one of the crazy things I've done started when I wanted to be able
to send a modem Break signal , something which Bobterm can't do but Omnicom
can. So I would quit Bobterm, go into Omnicom, send the break signal and
a couple commands, RESET out of Omnicom, go back into Bobterm, and continue
doing stuff online. The secret to surviving the RESET is the P:R: connection.
I had a MIO once and if you RESET the MIO would reset the RS232 port. The
P:R: Connection doesn't do that, which is really nice.

To program that kind of OS would mean A lot of work, and would require
I guess at least 256K of RAM. What you would probably do is run three
virtual computers on one machine. Not multitask, just task switch.
Each virtual computer would take up 64K so that all is saved, except the
OS extensions and stuff. Then which ever virtual machine you wanted to work
on would be copied from extended ram down into the standard 64K area.
That's one way anyway, it wouldn't allow you to peek at say the terminal
program while running the word processor though. It's a GREAT idea but
who's gonna spend that much time on such a project? I would be willing to
pay for it if it's within reason and worked properly. By the way, there
is something like this already out, meaning the task switcher, or virtual
computer thingy. I might still have it hanging around somewhere. It didn't
work too well. There was also a program called MTOS which I purchased in
1988. It stood for Multitasking Operating System. I actually had two
BASIC progams running simultaneously. It was sllooooowww though.

Interesting stuff, but it really pushes the 6502 speed and memory management
capability in the Atari 8 bit, maybe far beyond what it can handle.

Heads Up, Atari 8-Bitters!!

This Is For YOU!

Beginning 1992, the Atari 8-bit computers- and the community of
USERS who still cherish these machines- have been officially discarded
by Atari Corporation.

BUT WE REFUSE TO ROLL OVER AND DIE AT ATARI'S COMMAND!!

We believe there are enough of us left to pursue our 8-bit
interests independently of Atari Corporation.

Would you like to see a common forum in which users, developers,
and vendors can communicate? A print medium wherein advertisers can
be assured of reaching their intended audience, and where users can
look with confidence for information about new products? A user-
oriented publication to fill the void left by the collapse of ANTIC
and ANALOG?

My name is Jeff McWilliams, and I'm a dedicated 8-bit user. I
want to present the Atari 8-bit community the chance to gather under
one publication dedicated exclusively to the Atari 8-bit computers. A
magazine that will unite our community and give it the strength it
needs to survive. A forum where users can ask tough questions and
read unvarnished product reviews. A magazine whose ads will be almost
exclusively from 8-bit vendors.

I propose a write-in campaign to Atari Interface Magazine, asking
for a separate, exclusively 8-bit magazine called "Atari Classics".
Atari Interface Magazine already has a strong presence in the Atari
community. For several years AIM has been a combined ST/8-bit magazine
whose publishers have indicated a willingness to support the Atari 8-bit
community as long as interest warrants it. NOW is the time to ask them
for our own magazine!

As Campaign Manager, I will act as the focus for this effort. Now,
you might be wondering, "WHAT CAN I DO TO HELP?". That part is EASY!

Just SEND me your NAME and POSTAL MAILING ADDRESS. I will mail you
a FREE Information Kit describing our goals in greater detail. Included
with the Kit is a stamped postcard on which you can express your
interests and willingness to subscribe to an exclusively 8-bit magazine.
(Or, if you disagree with our approach, you can just toss it away and
that will be the end of it- BUT WE DON'T THINK YOU WILL!) You'll also
be invited to indicate your willingness to PARTICIPATE in the magazine
DIRECTLY by being a regular columnist, editor, or just writing about a

special project you did or review a product you used.

Ben Poehland, the former 8-bit Editor of Current Notes Magazine, is fully supporting this campaign and has offered to donate his services to "Atari Classics" when repairs to his fire-damaged home are completed later this year.

The cutoff date for receiving the postcard responses is:

MARCH 31, 1992.

If by that time I have received 500 positive commitments via postcard, they will all be sent to AIM along with a petition requesting the formation of our proposed exclusive 8-bit publication "Atari Classics". If I receive less than 500 replies, then we will know that the 8-bit community has indeed become a lost and hopeless society.

TIME IS RUNNING OUT. THIS MAY BE THE LAST OPPORTUNITY YOU WILL HAVE TO KEEP YOUR MACHINE ALIVE AND SHARE EXPERIENCES WITH FELLOW USERS.

IMPORTANT!! Only the OFFICIAL Campaign postcards will be accepted! Those responding by other means will be mailed an Information Kit with which they can register their official response. Regrettably, due to limitations of time and cost, the Campaign will be restricted to addresses in the USA only. However, unofficial responses from outside the USA are welcome and will be included in the final count.

PLEASE DO NOT SEND MONEY! If anyone wishes to assist the Campaign, they can do so by posting this release in its unmodified entirety to other on-line services, BBS's, usergroups, friends, and vendors. Additional assistance can be rendered by gatheringnames and addresses of Atari 8-bit owners and furnishing them to me so I can mail them an Information Kit.

If you're REALLY SERIOUS about keeping your Atari 8-bit classic computer alive, be sure to obtain the Information Kit and return the included postcard appropriately filled in. Every day more 8-bits get stashed in attics or closets, or simply thrown away. Atari's Classic 8-bit computers- the 800/XL/XE machines- are every bit as useful and productive today as they were in the heyday of 8-bit technology. They deserve a better fate than the local landfill!

>I want to see an OS a lot like Windows,
[description and examples]

Hate to dampen your spirits on this, but this just can't happen with the Atari 8bits. There are some fundamental problems: 1.79 MHz 6502 (a processor definitely _not_ designed for multitasking), pretty low resolution graphics, <1 Meg of ram unless you go to really outlandish harware, and no support from the beginning of relocatable code that doesn't assume it's got all the resources to itself. Under these conditions, it would be awfully hard to even do an effective 'switcher', where every program gets complete control while you are using it...

> A T A R I lives!

I do love my ol' 8bit, but it can't be made to do everything (at least not in a finite time...) If you really want to keep the 8bits alive, you have to realize some of their limitations as well as pushing ahead...

It is still available, and has probably been updated. A more interesting program is Switcher, which allows you to switch between several programs, although only one may be run at a time. This has some interesting applications, including running BASIC programs as modules with machine language BBS programs.
Speaking of BBS programs, anyone out there running a BBS who would like to exchange messages with me, leave me e-mail. Internet e-mail would be a good way to exchange the messages, and would work fine for the low volume 8-bit bases get.
Also, the number to Tom Hunt's BBS, the author of MTOS and switcher, is (419) 368-4413 (The Closer To Home BBS).
Hunt recently released a program, called CGS, which allows his BBS to do color graphics. It works with Bobterm (see Z-Magazine Issue #200 for details).

> 128K someday as it makes a better portable computer than the 800XL.
>
> Jeff McWilliams

Jeff, no I didnt misunderstand the 600xl at all. upgrading a 600xl isnt
cheap! Its either $25 for an atari made plug in module. OR! its $15 for a
64k upgrade kit. (check the BEST catalog if you dont believe me).
Also, The 600xl composite monitor kit is $12!!!!!
So how can you justify bothering to do all of this work on a 600xl when a
used 800xl runs $40-50 and doesnt have to be worked on at all!!!!
At the cheapest, the costs run $27!!! As for compact, that it is.
Its smaller, but I went from a 1200xl (undoubtably the FATTEST atari 8 bit
ever produced to an 800xl, the 800xl isnt a problem as to its size on my
desktop. I dont know of any XE compatable 128 memory upgrades out for a
600xl either. Just the 1200xl and 800xl.... Based on what my personal views
are and the costs, its doubtful that a 600xl would be little more than a raw
living donor for my 800xl..
(watch in horror!)

I didnt know that! I got mine second hand.. I just got a backup copy
and the manuals (proofreader disk too).. I didnt get the original
disk, and the version I have is just the 128k one!!!!
Now I have to track down this XL version.... Any differences?
Should I bother? I have 1 xe, and a rambo 800xl anyways..

Nope! not wrong, but theres a few more differences than that.
Thats the main one. Its also smaller and doesnt have a monitor jack.
It can be upgraded to become similar to a stock 800xl..
But its cheaper to get an 800xl used instead.

Here's a mod I made a few years ago in college.

| Ken Sumrall | Internet: ken%hpda@hplabs.hp.com |
| HP California Language Labs | UUCP: ...!hplabs!hpda!ken |
| "I'd stomp desert dope heads for some gas in my moped!" - Bill the Cat |
| "What a stupid world" -Calvin (speaking to Hobbes) |

==========

HOW TO UPGRADE YOUR ATARI 600XL TO 64K RAM

THIS MOD IS COPYRIGHTED BY KEN SUMRALL. HOWEVER, YOU MAY FREELY
DISTRIBUTE IT, AND MODIFY IT, AS LONG AS THIS NOTICE IS INCLUDED
IN ITS ENTIRERTY. THE AUTHOR MAY BE REACHED AT THE FOLLOWING
EMAIL ADDRESSES:
ken%hpda@hplabs.hp.com
...!hplabs!hpda!ken

You will need the follow parts to perform this mod:
(2) 4464 RAM chip, 64Kx4, 150ns or faster.
Additionally, you will need chip pullers, a soldering iron, and 3 small
pieces of wire. I used wire wrap wire when I did this mod.

If the chips on your 600XL are socketed, you're in luck, otherwise, you need to
first unsolder the following chips:
(1) 74S32 location U18
(2) 74LS158 locations U5 and U6
(2) 4416 locations U11 and U12
and put sockets on the mother board in their place to make the job easier.

Now bend up pin 9 on the 74S32, and put it back in its socket on
the mother board. Bend up pin 3 on the 74LS158 in location U5, and put it
back in its socket. Also, bend up pin 10 on the 74LS158 in location U6,
and put that chip back into its socket. The last two chips you need to
change are the two RAM chips. Put the 4464 chips into the sockets at
locations U11 and U12 on the motherboard.

Now you need to install 3 wires to complete the mod. The first wire should
be connected between pin 3 of the 74LS158 at location U5, and pin 20
of the parallel bus on the 600XL. The second wire should be connected between
pin 10 of the 74LS158 at location U6, and pin 18 of the parallel bus.
The third wire connects between pin 9 of the 74S32 at location U18, and
pin 45 on the parallel bus. That's all there is to it.

Two-bits from The Alchemist on Mubashir Cheema's cable/pwr supply
questions.
As Jeff said the pwr supplies for the disk drives are 9VAC 31W (about 3
amperes). These are not really power supplies, only transformers. Don't
bother trying to build one. Buy it. I bought several, pretty cheap (like,
$9 each) from B&C or ATV (can't recall which- check their catalogs).
ATV has a standing cut-rate offer on the special 9-pin Atari SIO cables:
3 for $10, I got some last year, they work fine. Don't bother trying to make
your own cables, I've done it & it's a pain in the butt. Cheaper to buy them.
The pwr supply for the 1027, as I recall, really is a pwr supply: I think
it puts out 9VDC unregulated.
The 1027 pwr supply is chunkier than the disk drive pwr packs which are
physically similar. Also, the plug on the 1027 is of a different diameter than
the plugs on the drive pwr paks, can't recall if it's larger or smaller. I
don't recommend you attempt to build a supply for the 1027 unless you REALLY
know what you're doing.
As Jeff mentioned, you can get most of this stuff at Best. However Best's
prices are not the Best (pun intended! sorry....). Shop around at ATV or B&C,
they have this stuff too, you could save upwards of 30%.
I don't have the address of B&C or ATV in my pocket, how about someone
uploading that info for our friend Mubashir?
For the most detailed info ever published on the power supplies for the
XL/XE computers (nitty-gritty-tekkie stuff) purchase the following back issues
of Current Notes magazine: Nov. 1990, Nov. & Dec. 1991.
1990 back issues are $2.50, 1991 back issues are $3.00.
Contact Joyce Waters, Business Manager, Current Notes Magazine, 122 N.
Johnson Rd., Sterling VA 22170 phone: (703)450-4761.
Hope this helps!

- BEN POEHLAND

93. 800xl vs 600xl

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-14 01:34:10 UTC
From: JJMCWILL@MTUS5.BITNET
Message-ID: <92013.203410JJMCWILL@MTUS5.BITNET>
Source record: 113140

Craig,

You're right on that. The 800XL is cheaper than getting a 600XL and upgrading it. I hadn't thought along those lines since I purchased mine with the 64K already installed and a friend of mine in TV repair gave me the monitor upgrade parts I needed making it cost me about $2.00 or so for the jack. Innovative Concepts DOES advertise a fully 130XE compatible 128K upgrade for the 600XL, but of course that doesn't compare with the up to 4 MEGS you can put into a 800XL, 1200XL, or 130XE using the Newell board.

Overall I still think the 1200XL is the best XL/XE that came out, especially due to the keyboard. I miss the fact that it doesn't have a parallel bus though, that would make it a real winner in my book.

From what I understand, the 800XL uses a customized version of the 6502 that has some buffers on some lines and such, and therefore the 65C02 is incompatible with it. I believe the 800 can use a 65C02 though. I've heard lots of talk about the 65C02 before, and this is what I remember about it.

Source record: 113143

I am an Atari 800 user starting in 1983 and love the 8-bits.
Someone has recently given me 2 of their old Atari 800 systems, but
unfortunately no docs or software was included.
I have some questions about the hardware that I have never used or seen before.

* What is a Mosaic Exsel board? This board has jumpers for the 800 and 1200
computers and has 2 cables going to the motherboard. It is not hooked up.
I don't know how the jumpers should be set or which pins the cables should
be attached to on the board.

* A non-working 810 disk drive has a Happy chip on the side board. Is there
a way to know what version this is? I have no docs or software for this
chip. As a test I put this side board in a working 810, but couldn't boot
DOS. The head does seek, though.

* What are the pinouts for the 850 interface? What power supply does it take?
I have a PR Connection, but would like to have the 850 for backup.

* General question: are the power supplies for the 800 and 810 interchangeable?

Thanks.

Thanks for the correction! It was just nice to see an Atari (even iif it wasn't an 8-bit being used for something besides games).

Is there anyone out there who knows the voltage(s) and current of an old Atari power supply. And further, do you know a source for one. Actually I know the sources...I just don't know their phone numbers. (Best Elec., etc...)

Thanks in advance

Matt Woodward
mwoodwar@eecs.wsu.edu

ARghjh...dadfad fadf $$#$#$@##@ GUYS!!! GET THE FACTS CORRECT!!!
CLOAK AND DAGGER was entirely based around the 5200!!! 5200!!!
Yes, the 5200!!! The whole store was filled with 5200 games
and there was an 800 sitting right next to the 5200 in the back of the
store!!!!! Now, can anyone tell me the name of the program
that was running on the 800????????? Let us not forget that
the sound effects from TRON were from an Atari 8-bit too!

Andrew

Yes, this we BOTH agree on. The first atari I got was a 1200xl off
the shelf the first day it was out. I had been told to not buy a
lower priced 800(tm) because a "BETTER" newer line was being released.
I loved the 1200xl, but it was annoying to use before TRANSLATOR came out.
I had a lot of stuff that wouldnt copy!!!
or work here.

109. Greetings!.. reminiscing..better OS

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-16 03:27:51 UTC
From: cashin@winkle.bhpese.oz.au
Message-ID: <1992Jan16.132751.148@winkle.bhpese.oz.au>
Source record: 113067

I've been reading this newsgroup for a month or so now, I was really surprised there is still a band of 8-bit supporters out there. I have a 400 and an 800 at home, the 400 has a fritzed keyboard but the 800 gets a fair bit of abuse from my kids who still like Canyon climber, Crossfire Frogger PacMan etc. I pretty much ignore the Atari on account of I haven't got a printer interface so all my work gets done on CP/M machines (An Osborne O - 80k drives and 52x24 screen or a Visual 1050 - 360k & 80x24). I also have an OSI Superboard (The big memory model - 8k) - will there ever be a time when vintage computers are worth money.

Well, a few questions -

(i) is there an Australian group supporting Atari 8-bitters? Magazines, retail outlets, clubs ...?

(ii) whats the story in the US ... lots of people ... struggling group of diehards ... heaps of free software and lots of addons from the sound of it.

(iii) I thought I might get the 400 back in action (silly me). I believe there was a keyboard with real keys someone made - does anyone have this to sell (and how much).

And now for some observations re a better OS. I worked with a multitasking operating system called Oasis on a Z80 (4 Mhz). This quite happily supported 3 or 4 users doing trivial tasks such as wordprocessing. The trick was bank switched memory. Each program loaded at location 0 and had 48k to itself. The total memory (256k in our case) was in 16k lumps and you could allocate 1, 2 or 3 banks to a process. The upper 16k was common to all processes and had the OS in it. So it should be possible to fool Atari type programs in somewhat the same way.

As for speed in task switching - the 6502 usually whipped the pants off a Z80 (1Mhz v. 4Mhz) so a 1.7Mhz should be capable of the job. The actual task switch overheads can be made quite low (under 100 usec.) with hardware assist. I wrote a 2400 baud comms handler on a Commodore 64 (which has no UART) and that had to parallelise bits coming in every 433 usecs. It also had to serialise outgoing, sometimes at the same time. So there was an interrupt every 216 usecs. There was a layer over the comms which handled error detect/correct (using sliding windows and CRCs) and over all that was running BASIC. The performance hit for the comms was around 20%-40% (short packets made more work). For the sort of task switching needed (say every 2 ms to switch on TV frames) there should be buckets of time.

I don't think you will get a better OS with just software (well, maybe a bit better) so a hardware/software approach seems best. But given the

limited market and the difficulties of writing OS's (that work ;-) there would have to be general agreement on how the hardware could be changed. Is it worth it...?
Alan.

> ourselves, yes? How many people out there have put a 65C02 in their Atari?

Atari never released a 65C02 machine, and it's regretful. Nice chip, isn't it?
Draws less power, too.

In the beginning, the 400 and 800 used the standard NMOS 6502 chip everyone
else used. Atari was purchasing 6502 chips in such a quantity that they were
having production runs for just Atari. Since the CPU board had a bit of TTL
glue logic on it, and some of that logic was just to massage the bus signals
from the 6502 (the SYNC line, wasn't it?), Atari had the TTL functions moved
onto the CPU chip to bring costs down. Hence the CPU rev B card had a pair
less TTL chips on it, and it used the Atari-specific '6502C' instead of a
normal 6502. The new chip wasn't completely pin compatible anymore. :(

If you can find an old CPU board, it's possible to plug a 65C02 straight in.
I've done that with one of my 400s. Or there is an upgrade or two on the
market (or used to be) that allowed you to pull the 6502C, plug a 65C02 into a
daughter card, and plug that card into the CPU socket. The daughter card
contained the TTL glue logic that's missing from the 65C02. This was the only
route for an XL/XE. Sorry, I don't know who made them or if they're still
available.

The 65C02 was especially nice for my Forth programming. The NMOS 6502 suffers
from the 'FF' bug... any JMP indirect via a 16-bit pointer when the pointer
sits on a page boundary will screw up. The Forth system did a lot of indirect
JMPs, so that saved us from scanning the object for bad JMPs after building a
new system using Synasm.

But on the other hand, the 65C02 would break any code that relied on illegal
opcodes. It's suprising just how much of it is out there. :) There were quite
a few games that would crash on the 65C02, and a couple of utilities as well.

Tom

Innovative Concepts operates out of lower Michigan. They have a catalog and I have one about 1 year old, but I'm at work so I can't offer any specifics at this time. They sell some memory upgrades for the 800XL, 600XL, and 130XE, modifications to connect the numeric keypad up to your XL so that you don't need the software driver, some Print Shop patches for the Okimate 10 printer and the new 24 pin printers YEMACYB, which is a program allowing you to print in COLOR on your printer, they also have a image scanner for the 8 bit that plugs into the cartridge port, and a BUNCH of other stuff. I will post an address and phone number when I get back home later today.

I purchased my first 1200XL after I had already picked up an 600XL
and had by 800XL for years. Mine has been upgraded to 256K,
the 800XL operating system and internal Rev. C BASIC. I liked it
so much that when San Jose was advertising motherboards and Keyboards
in perfect condition for CHEAP I picked an extra of both, although I
WISH I had several spares so that I could keep conputing into
the 21st century!

Hey, how's it going, haven't talked to you in a long time. Jeff's right about the 800XL using a modified 6502. I have the schematics for both the 800XL & 800 and the new design eliminated about 3 chips that were used as buffers/halt line => completely incompatable without adding the back the chips although I have heard you can plug one in a 800 W/O problems. There's and old Compute article on undocumented OP Codes & I remember someone on CI$ (Tim Patrick) saying that he had an illegal code for BRA, but none of the codes matched what the 65C02 used. Chuck Stein jumped in and advised that many of the illegal OP Codes for the 6502 translated into different OP's on the 65816. IMHO: Best to use macros i.e. a BRA => SEC BCS to simulate instructions.

118. Re: hooking up 810/1050 drive to ST

Newsgroup: comp.sys.atari.8bit

I think I have the pin-out for the Xformer cable somewhere, but it'd take me a month or two to find it <grin>. If you don't need Xmodem transfer there's a file on Atari Base (408) 745-2193 that shows how to hack a joystick cable to RS232 (RS232JOY.ARC) it'll go to 19,200 BAUD, but the ST can't capture that fast. For regular handshake type stuff, Xmodem, you can only go to 300 BAUD, but it will do two way transfers.

119. Making a null modem cable for 8bit to IBM/ST (how to)

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-16 19:21:48 UTC
From: drp9500@ultb.rit.edu
Message-ID: <1992Jan16.192148.21397@ultb.isc.rit.edu>
Source record: 113065
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I had posted a request for this information and I found it on a
local BBS. Several people asked me to share what I found so
here is the file on to build the null modem cable.

PRO Null Modem Transfers

1-17-90

Circular Logic
718-351-4304

It has recently come to our attention that many Pro SysOps are having
difficulty establishing a Null Modem transfer between their BBS and
a second computer, be it ST, IBM or XL.

It is quite easy and reliable as long as the correct cable is used.

The correct pinouts are as follows:

Note: should you mess this
up and blow up yourself or your neighborhood
we assume _no_ responsiblity! Get your pins right! They are labled
on any decent brand of connector. Here are views looking at the
'business' ends of the connectors-

Male DB9 Female DB25
1 2 3 4 5 13 12 11 10 09 08 07 06 05 04 03 02 01
6 7 8 9 25 24 23 22 21 20 19 18 17 16 15 14

Atari 9 pin to Atari 9 Pin or IBM/ST 25 pin

1 DTR *	1	20 Data Terminal Ready *
2 CRX *	2	8 Data Carrier Detect *
3 XMT	4	3 Recieve Data
4 RCV	3	2 Transmitted Data
5 GND	5	7 Signal Ground
6 DSR	6	6 Not Connected
7 RTS	7	4 Request To Send
8 CTS	8	5 Clear To Send
9 NOT CONNECTED		

*** Note IMPORTANT inorder to work with Pro and or Express, Tie
(short) pins one and two (DTR/CRX) together on the XL end
(and/or pins 8 & 20 on the ST/IBM end) This insures a Carrier
Detect for the BBS.

*Note: The only lines really needed are the lines on pins 1-5 on the
XL end
(WITH the pin 1 & 2 mod as above). This swaps the Send/Recieve
lines and forces a carrier detect for the BBS and grounds both
systems.

After hooking up the cable and matching baud rates (BAUD.CMD by
Circular Logic serves nicely to temporarly step up your
BBS baud rate for a null modem transfer) bang on the RETURN key
on the remote system untill the BBS 'sees' the keypress and
starts the normal logon process.
Programs tested to work on the remote are: 850 Express,
Express Cart,Flash, DualTerm, Procomm Plus.
-Hope this helped! -Tom & Bill

I have not built the cable YET, so I don't know if it works for sure.

Bob

Well, I just got back from vacation and boy was it frustrating. I have an unmodified 800XL and an SX212 direct connect modem. In Sacramento there is a public unix access number, but it uses vt100 characters. I tried to find term programs that would emulate vt100, but didn't succede (well, I did find something called vt10^2, but that didn't work -- I think it needed an 850. I also found a program called Kermit65, but I couldn't get it to work properly. I loaded a handler for the SX212 before using it, but I still couldn't get it to work, and I ran out of time before I could get much help from the locals).

So now that there are more people to ask, does anyone out there know of a vt100 emulator that definately works on my system (with DOS 2.5)?

Thanks, in advance.

You (or anybody else in the world) can get a free Computer Software Services catalog free just by calling the office:

Computer Software Services
716-429-5639
Monday-Friday 10am-5pm EST

The standard Black Box sells for $199.95. There are all sorts of add-ons and accessories, described in the catalog. CSS does not distribute products through other US companies, so you have to order CSS products from CSS itself. There ARE European distributors for CSS products. Again, call the office for this info.

Omnicom is a good one, the secret is just getting a good handler to work.
Omnicom is on the FTP site Atari.archive.umich.edu, and also is Bobterm.

Bobterm as mentioned earlier has an excellent SX212 handler in it that should
work with Omnicom although I can't verify this,, I don't have the SX212.

I know this game lives in the heart of loyal 8-bit Atarians forever, so I know that this is a good place to ask if anyone has maps or text files with hints relating to Alternate Reality: The Dungeon that they could pass along to me. Thanks!

I already have The City done, but always enjoy reading AR experiences anyway, if anyone wants (or can) pass those along as well. My main interest right now is in the Dungeon though.

Thanks again!!

127. MYDOS command line interpreter

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-17 15:54:23 UTC
From: news@bbn.com
Message-ID: <68343@bbn.BBN.COM>
Source record: 113071

As some of you know, I am currently modifying the DUP.SYS of MYDOS to (a) be driven by a command line instead of the menu, and (b) have it live in RAM under ROM like SpartaDOS so it can be entered without having to reload DUP.SYS.

I am making great progress, but I have run into some problems.

1. I am developing using an XEP80, and I have observed some strange behavior with the RESET key. Using stock MYDOS, when I hit RESET, the XEP80 driver continues normally. However, under my modified version, RESET causes the XEP80 driver to stop running, and the display switches back to the built-in 40 character GR.0 mode. I need to reload the XEP80 driver to get it back in.

2. Jeff McWilliams was kind enough to type in and send me information on the interface for passing command line arguments to an application, which I would like to support if possible. It seems the pointer to the command line argument is in 000A/000B, which is the DUP entry vector. I don't understand how it gets changed back so an application can JMP (000A) to exit.

Other stuff I am doing - my emacs-subset text editor for the XEP80, EMAX, coexists under ROM with DUP.SYS, so you can easily switch back and forth.

I may add a few utilities like simple versions of unix more, fgrep, diff, and tr, up to what will fit. more would go record-by-record, so you don't have to wait until the whole file is read in before you see any, like happens with copy foo,e: ; fgrep would be on literal match (non case sensitive); a simple diff can be small, I wrote a version in BASIC that turned out smaller than I expected; and tr, because I need it to convert ATASCII to my epson printer :-).

>Let us not forget that
>the sound effects from TRON were from an Atari 8-bit too!

not too surprising really. POKEY (the sound chip) was used rather heavily in the early eighties for most of their sound production. This includes their arcade games. And you thought they just did a good job of emulating the sounds. The reason for this was to try to keep illegal game cabinets from coming out - if you use proprietary hardware it's awfully hard to recreate from off the shelf components. Although I heard that some of the companies in the orient that were ripping off these games would just buy a bunch of Atari 8-bit computers, take POKEY out, and toss the rest as junk (although i suspeect they took a few more parts as well).

i discovered this stuff after i recognised the Atari part number for POKEY on the schematic for my Tempest machine. It happens to use a 1.5MHz 6502 for its main processor (with a "Math Box" for the vector calculations) and has only 20K of ROM in it.

Message-ID: <1992Jan18.171703.3156@fsg.com>
Source record: 113087

I've got two 8bits in storage (an 800 and a XEGS) and I was thinking of dusting one off and upgrading it a bit. I want to do assembly language and Forth development.

Possible upgrades for the 800 include a 65C02, the Newell Fastchip, and trying to find a 32KB RAM board and either an Axlon RAM disk board or the hardware monitor board (the one that went in the fourth slot).

Upgrades for the XEGS would probably be limited to a memory upgrade to 192KB. I have a couple of concerns about upgrading the XEGS. What do people use the extra RAM for? Is it just a RAM disk, or can your programs use it? I know the 130XE was able to bank switch program memory if you didn't use a RAM disk. Can machines with more than 128KB have both a RAM disk and bank switchable program RAM? My other concern is that the cost of upgrading the XEGS is probably more than the cost of a 130XE.

What other upgrades do people consider useful?

140. SIO2PC v3.00

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-18 18:43:10 UTC
From: omf@jab.tucson.az.us
Message-ID: <NuDReB1w164w@jab.tucson.az.us>
Source record: 113088

Hey folks, I just got a letter from Nick Kennedy describing the new version of SIO2PC. It sounds great!

Additions:

1) File access to disk images means you can now use disk images much larger than RAM (up to 16 MB). You can now define disk image size in any random size (in sectors, up to 65535) instead of choosing sizes from a list. Have all your Atari programs on one disk! Disk images will still be accessed as RAMdisks if possible, otherwise physical disk accesses will be used. The program still uses DOS files on the PC, no direct sector I/O.

2) You can now have your disks numbered from D1: thru D8: instead of 1 thru 4. This is for you fanatics who have 4 physical disks running already.

3) The program now answeres MYDOS (and other's) GET CONFIGURATION and SET CONFIGURATION commands, so those DOSes can be made aware of your new, large disk images.

4) You now get a warning before uninstalling a changed ramdisk which hasn't been written back to the disk.

5) There's a spiffy new COLOR user interface screen. Key fields are color coded to make it easier to see important statuses at a glance. Current PRINT_THRU status and chosen options are now displayed on screen.

6) The STATUS line is now new and improved. Two new fields tell you:
a) the current sector # being accessed, and
b) the amount of free RAM left.

7) A possible bug was killed which may have made it difficult for certain DOSes to recognize when a disk image was double density.

8) Formatting now clears the disk image to all zeros - so compression programs can work more effectively.

Current users of SIO2PC can upgrade to version 3.00 by sending $5 do Nick. This is EXTREMELY reasonable. I plan to use SIO2PC instead of getting a Black Box since I've already got a PC and there's no reason for me to go off and buy different hard drive especially for my Atari.

Nick's address is:

Source record: 113091

IMHO, If I had an 800 and a XEGS, I would probably upgrade the XEGS, although the 800 does have a better keyboard. With the extra memory in the XEGS (the 192K you mentioned) you could using the proper DOS such as MYDOS or SpartaDOS or SpartaDOS X, use part of it as RAMDISK and part of it for applications. For example, BASIC XE uses the extra memory. Textpro 4.56 will give you two additional windows of 16K each using 32K total of the extra RAM. Omniwrite could use ALL of your extra memory as one huge available space for writing your documents. Paperclip can use the extra memory as well if you can find that program. I am not sure how many others there are, these are a few examples. Note that Omniwriter requires the Omniview 256 chip from Newell industries. It only works in a XL/XE or XEGS. Other alternate operating systems are popular upgrades for XL/XE XEGS computers like the Omnimon XL chip from Newell Industries, which offers you a built-in machine language monitor. There's also the Ultra Speed Plus OS from C.S.S. which gives you all sorts of neat RAMDISK capabilities, high speed I/O from your modified 1050 drive, Happy 810 drive, or XF551 drive; and Translator 800 OS for those stubborn programs that normally don't like to run in an XL/XE or XEGS. If you really don't like the keyboard that comes with the XEGS, you could get a board which lets you hook up an IBM keyboard to your computer. Originally from Michael St. Pierre, Dataque now sells this board. I use a Northgate Omnikey Ultra keyboard on my 800XL, it sure beats the mushy original keyboard.

Just a few ideas...

Jeff McWilliams

In reply to looking for a bunch of power supplies.. San Jose Computer
listed some in a pamphlet a while ago:

XL/XE (except 1200XL) 19.95
800-1200XL-400-810-1050 9.95
2600-5200 4.95
7800 4.95
1027 12.95

That help a bit? THey also have some for the 520ST and ST354-SF314
(who?!)... You could also try B&C Computers, who sells a little more
8-bit stuf...

San Jose COmputer: 408-995-5080
B & C Computer: 408-986-9960

San Jose, is in.. San Jose!
B & C is in Santa Clara...
(CAlifornia...)

Well... look at Appleworks (not for too long... you'll kill yourself looking at an Apple!).. It's NOT multi-tasking.. it's not EXACTLY windowed, but close.. and it's like 3-programs in one.. I could easily see some program running a term, a wp and an arc/unarc er... probably much better on a 128 or 256k atari, but it's still possible! Windows (I mean in their deadest.. text mode!) is simple... Atariwriter + has only 12k or so free for text as it is, and I barely use all of it's functions... so I'm thinking for more of a program for while you're on-line... if you can play breakout while downloading, you can definitly edit a message for send.. If somebody wanted to spend a TON of time, the y could probably make something that would allow someone to program "in" it, making their own "switchable" programs... (Action! modules, maybe??) Oh well... yeah, sure it's difficult... BUT: shoot for the moon, you may hit a star!

Well.... I'm not too sure... either it's my 1200xl (they were faulty,
hence their end of production after 2 months) or just a bad upload.. but
I can't get several downloaded stuff to work...

On that note: Does anyone have AWESOME.DCM? It's supposedly a "stunning"
multi-segment demo.. I've tried a 1000 times downloading, filefixing,
and unDCMing it, but nooooo! I don't work!!! Help me! Anyone
have it?

Source record: 113093
Cross-posted to: comp.sys.atari.8bit,misc.forsale

I have the following system forsale

1. Atari 800XL (No power)
2. GTE floppy drive (No power)
3. 1027 daisy wheel printer (No power)

You might also need those S10 cables to connect them as I don't have
any of those either. Previously I was thinking of getting this thing to
work as the power supplies and cables are pretty cheap to get. But then
my parents after realizing how much I like Amigas bought me an Amiga 500
recently. Accidentally my Uncle bought me one too, so now I have two.
One is still boxed (never opened), I could let it go for $340 obo.
Drop me email at mac1@ra.msstate.edu for more information on it.

For the Atari I'll accept almost any offer (I just need to get rid of it)

Thanx for dropping in.
Mubashir

156. Re: WANTED: upgrade opinions

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-19 16:40:42 UTC

Message-ID: <1992Jan19.164042.9681@fsg.com>
Source record: 113094

I guess I should have been a bit more specific. I have another computer (a ST) to run applications on. All I will use the 800 or XEGS for is programming. Another advantage of the 800 is that everything is socketed. Installing the Omniview chip is what killed my 130XE. I remember Omnimon/Omniview coming out on the 800, so if I can find the chips/board that is still an option on the 800. Is Newell Industries still in business? If I can find a RAM disk board, I would be pretty close to the 192KB I can get in the XEGS.

What is the difference between SpartaDOS or MYDOS and Atari DOS? I have OSS's OS/A+ and its successor (I can't remember its name). How does OS/A+ compare to these? Are either SpartaDOS or MYDOS available for the 800?

157. Re: WANTED: upgrade opinions

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-19 20:46:56 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92019.154656JJMCWILL@MTUS5.BITNET>
Source record: 113098

Newell Industries is still around, their latest product is the 1088K upgrade
for the 1200XL, 800XL, and 130XE. According to their catalog they should
still have the 800 versions of Omniview, Fastchip, and Omnimon.
Mydos is similar to AtariDOS, meaning it's a menu operated system. Its
advantages over Atari DOS 2.5 include better Ramdisk support, Hard Disk support
, subdirectories, and Double Density disk drive support, or even 720K
3.5" floppy drive support. It is also shareware.
SpartaDOS comes in several versions depending on which computer you are using.
It is similar to OS/A+ and DOS XL but better in my opinion. It supports
subdirectories and all the Command LIne Interface advantages you are used to
with OS/A+. It also supports double density, 720K drives, etc.
SpartaDOS will work better on an 800XL than an 800 due to the ability to
load part of itself under the OS ROM in an 800XL. This means more features
are packed into the DOS itself, and not as external .COM files. With an
appropriate Ramdisk however, you shouldn't notice much difference.
SpartaDOS X is a cartridge which will work in either an 800 or XL/XE
computer, but you will have less available memory in an 800, again because
with an XL or XE part of DOS gets loaded under OS ROM, or with a 130XE or
an upgraded XL/XE into XE banked memory.

Please note that since ICD Incorporated decided to dump us 8 bitters in the
fall of 1991, all their products including SpartaDOS Construction Set,
SpartaDOS X, Action!, Basic XL, BASIC XE, etc will be very difficult to
find.

Best wishes,

I would like to sell my Atari 800 and components, but
don't know what they are worth. I'll put it up for bid
until January 26, 1992.

Details:
Atari 800 computer, 48K RAM, Basic XL, AtariWriter,
Asteroids cartridges
Atari 1050 dot matrix printer
Atari 810 disk drive, single density
Atari 850 interface, coverts 1 serial and 4
parallel ports
Indus GT disk drive, double density
BSR 1200 modem (Hayes compatible)
2 joysticks

Books:
Atari Sound & Graphics
Your Atari Computer
Games for the Atari
Computes! 1st & 2nd book of Atari
The Creative Atari
Atari Programming with 55 Programs
Various Atari magazines (e.g. Antic)

I used this computer through high school and it made my
life much easier. It's a good first computer.

Please send a bid to vonwaadn@kuhub.cc.ukans.edu if
you're interested.

Mark

All those were is a power transformer; 8 to 9 volts AC at 3 amps. Inside the plastic box is also a fuse. Use a vise to crack the glue joints to get inside. (do I need to tell you to unplug it from the powerline before you do that? :-) :-)). Maybe all you need do is replace the fuse.

I think in the "better OS" you were responding to me...
And as to the band of users... it's still pretty huge! You should try
calling AtariBase BBS (Atari Corp's "Official" BBS) (408)745-2196.
Also, I'm not TOO sure about Australian user groups and stuff, but
there's GOT to be some! I have this game called Xagon which to me looks
almost as good as something on an Amiga or ST, and it was from
Austrialia (actually...an actual users group.. MACE, I think?) (who
knows how old it is, tho..) And there's a bunch of stuff from Germany...
The Europeans support all use weirdo users.. ST, 8bit, Amiga.. rarely
it seems for IBM and Mac and such.. :) I want to move to Europe!! :)

Oh well... happy computing!

Well.. you can get an SX212 modem for $30 new from San Jose Computer (800) 726 8576 (408) 995 5080... it uses both an RS232 cable (for IBMs, STs, 850s, P:R:conn.'s), and the SIO (Atari 8-bits only)... You could just get the SX212, (SxExpress! is $10... NOT worth it.. since you alread have software)..

You SHOULD really get BobTerm (hopefully the newest, like 1.21.. I think the place that I got it from (I'm sig-op) lost all it's 8-bit files, so I'll re-u/l it soon (within a week) it's castle of Blackthorn (415) 883 2236... I'm PhBill on there as well) On AtariBase (408) 745 2196, there are some SX212 handlers (you would download it, rename it RS232.COM, and have it on the disk as you load BobTerm...) I think I got mine from AtariBase, but I will also upload it to Blackthorn, so you could get both of those there within a few weeks..:) Hope it helps!!!

What type of input does the monitor take (never used an ST)?
If it has the composite in (like you'd hook up the switch-box to), just
plug that in.. If it has two RCA in's (Audio/Video), just get a
monitor->RCA jack.. (called a Commidore Monitor Cable in MCM's
catalog..(800) 543 4330

Well.. looks like I have Mapping The Atari on it's way.. Action! looks
to be coming soon, too... I found someone willing to sell ComputerEyes
and the Parrot... I talked to StarFleet Software (very strange... lives
at his parent's house, it sounds like!!!) about his XMM801 printer
dumps/etc...
What else do I need!? (other than a HD, more RAM, another drive, and a
2400 or 4800 modem!?!!? yeah;---RIGHT!!)

I am interested in getting (what I meantioned before) YEMACYB (I can't
believe I memorized that!) It's a color screen dumper for b/w
printers... All I k-need to k-now is if it would work with an XMM801?
And also, how could I get it, and what software would it use... and,
duh.. of course... where in the hell I could get >>color<< MT80/81
printer ribbons!!!

So... let's see... anything else?? Oh..oh.. maybe a new xmm801 printer
cover... (mine's been glued back together so many times, and is covered
with so much tape over all the new cracks, that it looks TERRIBLE!!)

Well.. n-e-1 no where to get YEMACYB and an
xmm801 cover?? tanx in advance!
PhBill

I think I'll post my message from AtariBase about where/when people got their Atari 8-bits and whatever else.. Only 1 problem... I won't be calling them for a while (LD$$!), and I only realized that I had a capture buffer full of stuff 1/2 a sec. AFTER I turned the computer off (ARRGH!)...

I also am wondering where all these "international" people are? InterNet's supposed to be "international", isn't it??? That's what I've heard!!!

Oil wel... happy 8-bitting!

From: JJMCWILL@MTUS5.BITNET
Message-ID: <92020.001132JJMCWILL@MTUS5.BITNET>
Source record: 113099

Previously someone inquired about Innovative Concepts and I have finally
got off my duff and written a reply.

Innovative Concepts has their own line of products, as well as carrying
a wide range of new/user atari equipment, much of which is hard to find
anywhere else. They don't publish this stuff in their normal catalog,
as they only have a few things here and there so if you are looking for
something give them a call. Here is a list of their regular product
offerings:

Easy Scan - image scanner requiring an XL/XE with 128K and an epson
compatible printer. The scanner's fiber optic cable is
actually attached to your printer's print head and the image
is fed through the printer.
SIO PORT BOX - For devices like the P: connection from ICD, the Supra Micro-
print, XM301 modem, etc. It has three SIO ports on it.
SIO Switch Box - allows you to swith SIO devices, say between two computers.

Modem Mouth - a speaker for modems with no speaker so you can hear busy tones,
etc.

Memory upgrades, 600XL to 64K or 130XE compatible 128K
800XL to 130XE compatible 128K, or Rambo XL comp. 256K
XEGS to 128K or 192K
130XE to 192K, 320K, or 576K
65XE to 128K, 192K, or 320K
Ramdrive utilities: lots of neat utilities for owners of computers with
extra RAM, not for Newell 256K owners. This comes
free with all their memory upgrade kits.
ICX-85 keypad- a modified CX-85 numeric keypad that is wired into ANY 8 bit
and works all the time. A deluxe version gives you the 1200XL
function keys on the keypad, but only for XL/XE/XEGS computers.
They also sell a kit to modify your own CX-85 keypad into an
ICX-85

Function Key Kit - a separate set of 1200XL function keys you wire into your
XL/XE computer.

Ram-AID - A guaranteed cold start switch, allowing you to reboot your
computer without powering down, which saves the contents of
extended memory.

IC 1050 Controller - allows you to write to the back (flippy) side of
disks on your 1050 disk drive without having to punch
the extra hole.
Immitator Controller - for Happy 1050 owners, gives you control over fast/

slow read write, and control of write protect.

XF35 Kit - turns your XF551 into a 720K 3.5" disk drive.

Yemacyb and Yemacyb/4 allows color printing on dot matrix printers using 4 color ribbons.

I believe they also have a new disk for Happy 1050 owners allowing true US Doubler emulation.

Innovative Concepts can be reached at:

31172 Shawn Drive
Warren, MI 48093
313-293-0730

I am in now way shape or form affiliated with Innovative Concepts.
The above descriptions only briefly describe I.C. 's products, please obtain further details before ordering.

176. Mail Campaign: Update

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-20 22:51:40 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201202251.AA05174@smithkline.com>
Source record: 113103

Indications are that the Press Release posted by Jeff McWilliams a week ago on the IA8 Digest is slowly wafting its way across the various barriers that divide the 8bit community. To those of you who have been spreading the gospel to these distant parts, a hearty thanks from Campaign Headquarters.

[Definition of "Campaign Headquarters": Jeff's apartment!]

Jeff tells me we had 61 responses the first week. Not bad, considering we are mostly relying upon networks & word of mouth. However, logistical & financial planning (that's my department) for the Campaign call for an average of 100 mailings/week for 10 weeks; a total of 1000 targeted mailings. So in the weeks to come I'm hoping we'll see the weekly figures increase.

There are no doubt a few of you in this newsgroup who have't idea what this is all about, what I'm even talking about here. Not to worrry. Jeff will be periodically re-posting his original Press Release to the Net, probably every 2 weeks or so, for you laggards, slowpokes & latecomers. We apologize to those of you who probably grow weary of seeing the announcement, but we beg your indulgence for the good of the community.

A number of vendors have expressed support for our efforts, as follows:
Computer Software Services
Best Electronics
MAPDA/KO Distributors

DataQue Software declined our invitation to participate in the Campaign, tho of course there is still plenty of time for him to change his mind.

Advertising copy was sent to several publications. The following magazines have expressed support and/or agreed to run our ad:
Atari Interface Magazine
Current Notes Magazine
Atari Explorer Magazine

Coverage in AtariUser Magazine is somewhat doubtful at this time, as we were counting upon DataQue for that. Also, due to publication schedules it is uncertain whether there will be time for any news/ads to appear in Explorer prior to our ad cutoff of March 15 (the enxt issue of Explorer will be Mar/Apr, which might be too late).

There have some annoying technical/logistical difficulties which have

There were some annoying technical/logistical difficulties which have delayed the first bulk mailing. First there was the problem of printing a standard form onto the backs of the postcards. Then Jeff lost access to his copy machine when its owners realized the volume of material he wanted to run off. These problems have now been solved, the first production run of Infor-

mation Kits is now en route to Jeff, & if we are VERY lucky the first bulk mailing could go out as early as this coming Saturday (tho more realistically it will probably be next Monday or Tuesday). Jeff is manning the front lines while I cover the backfield, we are working well together, & despite the start-up problems everything appears to be on track.

I'm *dying* to tell how I solved the postcard problem. Maybe that will make a nice article in the premier issue of "Atari Classics".....

There is space on the postcards for people to add personal comments & suggestions. I doubt if that material will get entered verbatim into Jeff's database, but I'm real curious to find kind of stuff people will write there. database, but I'm real curious to find out what kind of stuff people will write there. Perhaps Jeff will give us an occasional tidbit gleaned from the cards?

If you haven't sent your mailing address to Jeff, do it now:

jjmcwill@mtus5.mtu.edu

If your mail bounces, post it to this digest, & Jeff will get it here. Remember, postal addresses only, email addresses don't count.

One last thing. When our ad copy was sent to Explorer, John Jainschigg responded with a proposal that caught the Campaign Staff by surprise. Basically Explorer offered to assume responsibility for publishing Atari Classics. Insofar as there are some controversial elements to the proposal, it was felt the best thing to do would be to upload the text of his GEnie message to this Net & monitor your responses. (The Campaign was initially targeted to getting AIM to publish our mag.) Immediately following this msg, my next post will consist of the text of Explorer's proposal, for all of you to see & evaluate.

Text to follow.....

>Hey folks, I just got a letter from Nick Kennedy describing the new version
>of SIO2PC. It sounds great!

How about access to PC printers (Parallel port) and modems (internal
or external modems)? Or even a new K: driver which uses the PC keyboard?

Since SIO is basically a 19.2Kbps serial port, I would presume it would be
relatively easy to have a PC or other similarly equipped machine provide
complete peripheral support (disk/modem/printer) to an 8bit. This is
something I'd want to see more of.

Item forwarded by B.POEHLAND to J.MCWILLIAM3 K.WICKERT

Item 9071519 92/01/14 14:04

From: EXPLORER Atari Explorer

To: B.POEHLAND Benjamin L. Poehland

Dear Ben,

Now that I've read your advertisement, I have three thoughts. First, I'll have to remove Explorer's name from it, prior to publication (why would I print anything that included a line like "... are you disappointed at the declining 8-bit coverage in ... Explorer")? Second, I'd like to put it in the magazine, FREE, as a News item (after all, this is only market research, right?).

Third, and most important, I think you're all crazy for trying to start your own magazine (grin). Seriously -- why work for love, if you can work for money? 8-bit people are VERY cheap, and on the kind of response you're going to get from this ad (or from a real subscription offer), you'll be able to offset the cost of producing only a very meagre newsletter. I guarantee it.

Instead, why don't you get your people together, and decide how many magazine pages (at about 600 words per page) you can fill every two months. Then come to me with a plan, and proposed lineups for two or three "issues." I'd suggest we fill -- TIGHTLY -- about 8 pages per issue ... think you can do that?

Then here's what *I'll* do. I'll have the material art-directed so that it's beautiful, and publish it in Atari Explorer, in its own little section, under a name that you and I jointly decide upon. And I'll pay you and your colleagues for the material you supply. Cash in hand, rather than bills up-front. Sound okay?

My way, you get to hit 70,000 readers per issue, in a four-color newsstand glossy with worldwide distribution. Believe me -- it's a lot easier than publishing on your own, plus you get to be famous. All *you* have to do is supply the material and necessary illustrations (i.e., diagrams, photos of hardware, etc.), and then do some publicity to insure that subscriptions to the magazine get purchased on the basis of "vastly increased 8-bit coverage."

For this to work, there are also two other requirements. First, we have to have permission to use your name as a publicity vehicle ("Award Winning former 8-bit Editor of Current Notes"). And you have

to be willing to work with our present 8-bit Contributing Editor, the very competent and friendly Elwood J.C. Kureth.

Very truly yours,

John B. Jainschigg
Publisher/Editor
Atari Explorer Magazine
Atari Corp.

> MYDOS available for the 800?
>

Well.. I don't know much about SpartaDOS, except it is run via CLI
(command line interpreter... type in commands) not a menu (like Atari @
MyDOS).. MyDOS is pretty powerful compared to AtariDOS, as it, as well
as SpartaDOS, can support subdirectories (a directory within a directory,
much like folders on Macs, STs, Amigas, and all those other Icon related
computers).. MyDOS is also PD, while SpartaDOS is $old.. Also,
SpartaDOS comes on either disk or cart, while the other 2 (being PD and
coming with the drive) are disk ONLY... This help?

SIO2PC does support access to PC printers. It could, in theory, give access
to a modem as well. The keyboard would be more difficult, since that would
mean actually writing a new driver for the Atari, while the idea behind
SIO2PC is that the Atari remains unchanged - it is the PC which does all the
work of acting as a standard disk drive or printer.

Was Tempest ever released for the 5200? I remember seeing it advertised,
with a reference to a future date for release. I bought a 5200, but
heard Tempest was cancelled... I sold the 5200 shortly thereafter,
and bought an 800XL ($249 at Toy's R Us at the time), and never
heard anything else about Tempest .

Any information regarding Tempest, would be welcome...

John

Source record: 113020

Bill,

Yes, you have to load some kind of new XEP80 handler when you want to
access it, as it rewrites E:. The Atari handler also rewrites P: to give
you access to the XEP80's printer port. This is why the XEP80 won't work
with programs like Printshop, that BOOT without going to DOS, because you can't
load the driver. The printer port is also not accessible from Sparta-X
because SD-X's XEP80 driver is a screen driver only.
Daisy Dot III despite all my fooling around would also not work properly
with the Atari XEP80 handler, it couldn't recognize the printer port.
What needs to be done is an alternate OS written with the driver in ROM,
so it would be guaranteed to work ALL the TIME.

I remember seeing quite clearly a 5200 Tempest box shown in the background of one of the scenes of 'Cloak & Dagger'. I never saw the game for real though. I did see some games converted from 5200 versions to run on the 400/800 series. What games were made for the 5200 systems that didn't make it over to the computer systems?

I have seen Qix, Vanguard, Dig Dug, and Blueprint running on my 8-bit computer which were originally written for the now defunct 5200. (Qix and Dig Dug were *different* versions than what was released for the 400/800's). I remember a talking baseball game where the umpire called out 'strike', 'ball', etc. but never converted over. (I tried my hand at converting 'Blueprint' and was slowly successful until someone gave me the converted file to put me out of my misery.)

The file "bbvsmio.arc" at the atari.archive.umich.edu anonymous ftp site
contains detailed descriptions of the Black Box and MIO hard drive interfaces
for the XL/XE machines.

B&C Computer Visions in Santa Clara CA has the 800 OS source listing &
technical ref. including schematics. (408)986-9960. Unfortunately if you
need the XL OS, I don't think it's available anywhere.
I 'think' they want $10 or $20 for the docs, but it's about 10 lbs of lit.

One of the main objects of the campaign, as I understood it, was to create a PRINTED publication that covers the 8-bit Atari market EXCLUSIVELY. So there would be no question as to the magazine's loyalty to the 8-bits.

Do you know how many 8-bit product reviews Atari Explorer published in 1991? Exactly one: a review of ICD's Flashback!.

Atari Interface has shown it is interested in the 8-bit market.

Atari Explorer is owned by a company that does not support us, Atari Corp.

Do we want our magazine to be run by a company that does not support our market? I say not.

Bill,

I kept screwing up. I have CC65. The atari.archive.umich.edu has CC65.
It is complete. I think I also have all the extra add-ons that people
wrote and put up on GEnie, and I didn't see them in the a.a.u.e.
When I get a chance, I will try to get that stuff up on the archive, as
many people have expressed interest in it.

Bill,

Regarding batch files, SpartaDOS supports them as does SpartaDOS-X.
SD-X does a better job because you can pass parameters to the batch file.
the batch file could be:

copy %1 D8:SUBDIR%2
erase %1

then calling the batch file from the Command Line like:

A:DOBAT MYFILE.DAT NEWFILE.DAT

would copy the file from A: to the subdirectory in D8:, and then erase the
original automatically.

Unfortunately, SD-X and SpartaDOS didn't handle looping or any kind of
decision making or branches. Someone at one time did make some kind of patch
for SpartaDOS that was supposed to do a branch. I tried it and it didn't work.

Source record: 113038

Searching for advice:

I went burrowing through my closet the other day and came across a few things
that I would just as soon get rid of and I was hoping to get a few suggestions
as to what some of these are worth. Unfortunatly it has been TOO long
since I did much in the Atari world. Email advice would be appreciated.
The following is what was disintered:

-800
-600XL(no power supply)
-810 Drive
-Amdek 3" Drive (you read it right, NOT 3 1/2 but 3")
This includes one spare 3" drive and three 5 1/4 DD drives that
it is able to control, 20 3" disks and an XT power supply.
The spare drives and power supply were for constructing a 4 drive
unit for the Amdek's controller to run.
-850 interface
-1030 300bd modem (I can hear the Oooo's and Ahhhh's ;>)
-SX??? 300/1200bd modem
-Monitor (Green screen w/ sound)
-Printer Epson RX-80

I'm running out of closet space and I only want to keep one operational
atari system now <just for games anymore... sorry... :) > and I need to
get rid of most of this stuff. Don't know when I'll get around to selling
it but it would be better if I knew what I could get for it before I try.
thanks

mike

196. P:R:C/MyDOS v. SpartaDOS

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-21 23:38:22 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9201212338.AA07839@smithkline.com>
Source record: 113039

In IA8 V92#9 Brian Reynolds inquired about the ICD P:R: Connector & the various DOSs.
I own 3 PRC's & 2 850's, my preference is for the PRC. The 850 is a wonderfully flexible device, w/4 rs232 ports & I think one or 2 parallel ports (can't quite recall on that). My gripe against the 850 is just that it's so darn KLUNKY. You got this box w/wires sticking out of it literally from every side, there's no way to mount it nicely, it is physically large, & it adds yet another separate power pak/cable to the impossible rat's nest behind my 800XL. In fact for most applications the 850 is overdesigned. Most users only really need one serial port & one parallel port. ICD attempted to fill the bill with a more spartan approach that was much smaller, gave you just 2 serial & one parallel port (one of the serial ports is stripped-down), & eliminated the bulky pwr pak & extra wires by drawing pwr from the computer.
I have found 3 caveats to be observed w/the PRC. First, early versions were incompatible with some software & unreliable. They finally got the bugs out with REV 4. Unfortunately theres no way to tell what rev you're getting when you buy one, they all look alike on the outside. You have to open the case & look at the circuit board for REV 4. Second, the price ICD paid for fixing the bugs was higher pwr consumption: REV 4 has 5 or 6 chips including a revamped version of their 44-pin custom SMT RIOT/ROM. Depending upon pwr supply performance & cable length, actual +V into the PRC might be too low for reliable operation. I replaced the fixed SIO cable with an SIO socket so I could use longer cables (required cutting an extra hole in the case) which didn't help any. To ensure good volts I installed a buffer cap- 220uF- across the pwr/gnd input pins on the SIO connector on the PR board; I also use a hefty supply: the Squeezed Queen described in the Nov/Dec 1991 issues of Current Notes. Thirdly, I encountered occasional failures of the PR to upload its ROM handler when called upon to do so by variuos telecom progs, usually with the result the prog wouldn't boot because it couldn't find the PR on the line. This turned out to be due to too many feet of SIO cable in my setup, & could not be solved by placing the PR earlier in the chain. The solution was an SIO amp cable from CSS. For the past year everything now works great, I take the system for granted & don't even think about it when it's in use, it just works. Might seem like a lot of trouble, but it was worth it to me just to free up workspace & get rid of the extra wires.

Brian's query RE: differences between MyDOS & Sparta is too complex for a simple answer in an electronic forum like this. Fortunately the subject was addressed, in exquisite detail, by Charles Cole in a series of articles that appeared in the Aug, Sept, & Oct. 1991 issues of Current Notes. There was also a wimpy article on the same topic in the Sept AIM, but the CN articles are far better & *highly* recommended reading for ALL 8bit owners. The articles are relatively non-technical in nature, are primarily discussions/comparisons of features, advantages, etc. of each. Any 8bitter who missed those articles, is

well-advised to snap them up while they are still available.
In fact, given the increasing rarity of ANY info on these machines, anybody
who doesn't buy up back issues of available magazines RIGHT NOW, while they're
still available, is missing the boat!

Current Notes back issues:

1987: $1.50 ea.
1988: $1.50 "
1989: $2.00 "
1990: $2.50 "
1991: $3.00 "

I Wanted! atari 8bit hardware. I am looking for hardware for my
800xl. ANyone who has or knows the were abouts of any 8bit hardware and
is looking to rid of it please responde.

Here is what I am looking for:

810 or 1050 floppy drive
A hardrive
P.R connector or 850 interface
RAMdisk
memory expansion 128K-1meg
rat
compatable printer

Well I guess that thats enough for now.

nybody with any of this stuff who wants to make some
dough, please reply.
Thanxs, Doug

199. Kermit-65 problem

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-22 02:39:20 UTC
From: doom@leland.stanford.edu
Message-ID: <1992Jan22.023920.7059@leland.Stanford.EDU>
Source record: 113044

Well, I messed around with my modem a bit more (the problem, is to connect an old Atari 800 to a 1200 baud Percom via an Atari 850 interface), and I got it to the point where I could dial out and connect to another computer. There seems to be a problem with Kermit-65, though: the lower half of the screen starts out covered with bitmapped graphics garbage, and when it fills up (i.e., it should begin scrolling upwards), the graphics garbage moves up and fills the whole screen.

Does that ring any bells?

I'd guess the real solution is for me to switch software... Frank Seipel was telling me "Bobterm" is better, I'll just have to hassle with getting it out of the archive sometime and onto an atari disk...

BTW, when I say *old* Atari 800, I mean *old*. This one of those jobs where you open a compartment on the front to install cartridges (there are *two* slots inside), and when you open the door the power is shut off. I think it's only got about 48K of memory installed.

>garbage, and when it fills up (i.e., it should begin
>scrolling upwards), the graphics garbage moves up and fills
>the whole screen.
>
>Does that ring any bells?

I've seen this! I run Kermit-65 on a plain 128K 130XE under SpartaDOS X. I have encountered this same affliction with K-65 when I didn't have the memory configured just right. K-65 requires 48K - I would guess that either your 800 doesn't have 48K, or you have something else loaded, like a memory-hogging DOS, that's taking up memory. Kermit-65 definitely IS supposed to work on a 48K 800 - it was produced on one!

>
>I'd guess the real solution is for me to switch software...
>Frank Seipel was telling me "Bobterm" is better, I'll just
>have to hassle with getting it out of the archive sometime
>and onto an atari disk...
>

Which is better depends on what you want to use it for. For BBSing, BobTerm is the hands-down favorite. For connecting to a main-frame (i.e. VT100 emulation), I consider Kermit-65 the best. Or, if you want to do VT100 on the XEP80 eighty-column screen, VT850 is the only way to go.

>BTW, when I say *old* Atari 800, I mean *old*. This one of
>those jobs where you open a compartment on the front to
>install cartridges (there are *two* slots inside), and when
>you open the door the power is shut off. I think it's only

204. Printer Help

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-22 17:23:24 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92022.122324JJMCWILL@MTUS5.BITNET>
Source record: 112955

I have been doing my EE lab reports on my W.P. and have recently run
into the need to use Greek symbols, as is the EE way I suppose.
I am using a Epson LQ570 24 pin printer.
I finally figured out how to print the Greek symbols that come in the
standard USA character set in the Printer, after days of Italics
instead, and banging my head against a wall. Anyway, to my surprise
I realized they are only the Capitol Greek symbols, and I am missing
the one that looks like a small w, which stands for angular velocity
ya know, w=2(PI)f (sorry I don't know it's name, kill me...)
So I looked in the manual on how to maybe just redefine some of those
stupid EPSON graphics characters into small Greek symbols.
The manual is sketchy at best on how to do this, and I tried and tried
to down load custom characters into the printer to no avail.
The manual really irritates me because in comparison to the Panasonic
1091i I used to own the Epson technical section sucks dirt.
The Panasonic manual clearly explained each and every command, listing
exceptions to how each command worked, how to reverse each command,
and BASIC examples of how to use every command.
Heck, it even included templates for designing your own Character Sets!

I am planning on writing Epson, either cursing them for such a
horrible technical section, or requesting the additional information
that I need to clarify what the heck I am doing wrong.
Can you give me any clues as how to further pursue this project?
Anything would be helpful.

Sure. Call B & C Computervisions and ask for the OS Source listings. They
are for the original 800, not the XL/XE, but they are still very useful.
I think it sells for about $10.00.

The documentation consists of comments in the source, but it is very well
commented.

Hi,

I'm trying to build the sio2pc interface from the file
sio2pc212.arc at atari.archive.umich.edu. I was wondering
if anyone has made this version and had it work. I'm a
little confused because I read in some file something
about getting rid of an inverter. Now I can't find where
that was, and I don't know if I have the correct schematic
for the software. The data line to the Atari was not in
Tri-state when it should have been, and the command line
was low instead of high (or at least that's what the
status line showed).

I've got the data sheets for the ICs, but no DMM to check
voltages with. Did anyone have these same problems?
How can I get ahold of Nick Kennedy (does he have email)?

Thanks.

Todd Greenfield

>P.S : I'm very very interested in getting this thing to work.

You might try to contact San Jose Computers in San Jose, California. They
have a big supply of 8-bit surplus parts, as far as I know including 110V
power supplies and all kinds of cables.

Their phone number should be available through directory assistance. If you
cannot get it, email me and I will look it up for you.

Stephan

Shawn,

Mydos is about the same size memory wise as Atari DOS, perhaps a little bigger. It is faster when accessing some file I/O routines if I remember correctly. It can access either Axlon type Ramdisks for the 800 or RAMdisks for the XL/XE types up to 1 meg, or 4 megs.

Well, I got the downloadable character problem solved after bugging Epson's tech. support and getting a FAX of a sample program. Why wasn't this in the manual? From correspondance with others, earlier Epson manuals, even the predecessor to the LQ570 had better documentation and BASIC examples. The problem I discovered, the manual confuses sending "0" and CHR$(0) which boggled the whole routine.

The emergency is over, now all I need is more detailed info on bit-mapped graphics and how to figure the proportional spacing for proportional fonts. I'm in no hurry for these but I would sure appreciate obtaining this info. Epson said "We don't have proportional tables, try printing each character and measure its width by hand" Yah, right.

(Re: XEP80 not working w/ software)
I am wondering how exactly the xep80 works, with the Atari's constantly "jumping" screen.. If, say, I had text on the top of the screen, and then a line or two of static text, that is POKEd or something, NOT calling the E: handler or PRINT procedure, and this text was in a different area of memory than the rest of the screen (using a DL jump), would the xep80 work??? Thanx

PS. was that message to me??

There is a file that is compatable with SpartaDOS that allows passing of parameters whrn using batch files. A local user wrote is and it works well. I just got my hands on it, and think it's great. Actually, I have around 165 utilities that I use with SpartaDOS 3.2d that allow me to do basicly everything SpartaDOS X does, up to and including keeping my hard drive directories and bitmaps on a floppy just in case. There's LOTS of stuff out here for disk based SpartaDOS users.

I find the offer from Explorer to do an internal 8-bit magazine puzzling. Surely, as a magazine reported to support ALL Atari computers, this would include the 8-bit by default. I've never seen a copy of Explorer, so I can't comment on its editorial comment - would someone let me have there postal address or telephone number.

Is explorer heavily biased towards the ST/TT?
Does it cover the Lynx, VCS, Portfolio, ATW?
What is its strong and weak points?

Would someone let me know.

Regards

223. WANTED: Your old Atari 8-bit computer stuff...

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-23 11:25:28 UTC
From: ereidell@media.mit.edu
Message-ID: <1992Jan23.112528.18173@news.media.mit.edu>
Source record: 112961
Cross-posted to: misc.wanted,comp.sys.atari.8bit

Greetings. My name is Evan A. Reidell and
I would love to take care of the old Atari 8-bit computer
that has been sitting alone, unused and unloved for so many years
in your basement or closet or attic.

If you have such stuff
(Atari 400, 800, 600XL, 800XL, etc.)
and you've been wondering what you were going to do with it
I would like to take it off your hands.

I'm willing to pay all shipping costs to me,
plus some small fee or something... we can work it out...

Basically, I'm asking you to give me your old Atari 8-bit stuff,
so that at least it's being used somewhere, by me and my friends...
If you're interested in this "offer", send me e-mail or call (617) 225-9539.

Evan A. Reidell (ereidell@media-lab.media.mit.edu)

224. XMM801

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-23 11:28:58 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Jan23.112858.11988@aber.ac.uk>
Source record: 112974

There seems to be some confusion over the XMM801. From a hardware point of view it is basically a Shinwa CP-80 printer, with an Atari manufactured interface card added in the back. The main boards and the mechanics were manufactured by Shinwa. Atari just put the whole lot in their own cases. AS for compatibility, well I calculate it's about 75% Epson compatible. It works with Daisy Dot 3, and will print out mode 9 graphics OK. It wont work with many commercial packages with standard Epson output. My XMM801 has a head fault at present, so I'm looking out for a second hand Shinwa. All I'll have to do is swap the mechanisms over.

The other point of this posting is to let you know that I have presently failed to find a US distributer for my new commercial release Digi-Studio. For those who don't know, Digi-Studio is a digitized music manipulator. It allows you to play music in real pitch using various digitized sounds, ranging from church bells to babies crying! It has a keyboard player, which uses the computer keyboard like a piano keybaord to play music. It has fully responsive keys, so that sound only plays for as long as a key is held down, just like a synthesizer. The second part of Digi-Studio is the tune player. This allows you to play pre-programmed tunes using any of the samples supplied. There are 5 tunes on the disk to play. The package comes with over 25 sound samples and a printed and bound manual. If you are interested in distributing Digi-Studio in the States, then please mail me on: djg0@uk.ac.aber. Alternatively, post to the net. I am very eager to make Digi-Studio available in the States, after a positive take-up in the UK. I look forward to hearing from you!

Dean Garraghty.

225. cartridge telecomm. software?

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-23 14:04:38 UTC
From: yonder@netcom.COM
Message-ID: <1992Jan23.140438.2500yonder@netcom.COM>
Source record: 112965

Are there any telecomm. programs available on cartridge? I seem to recall that maybe there was something called telelink or something. It just seems like a incredibly cheap way to get friends of mine onto email. The could use old (cheap) atari 8-bits, fish up some (cheap) SX212 or something and they could be online. And to make it even cheaper and easier a comm. program on cartridge. I used to have a 1030 (actually I still have it somewhere I think). Didn't on of the old Atari SIO modems have a comm. program built into it somehow? Does anybody remember this? Any ideas on how this could work (or ideas on how to get people online for even cheaper) ? Seems like old dumb terminals would be a good way to go (80 columns) but where could I get a few cheap?

Source record: 112966

Amos,

Well geesh how come I haven't seen it on GEnie or on A.A.U.E? You holding
out on us? With 165 utils for SpartaDOS, I always thought it would be great
to write a compiled manual with all the docs of all these utils in it, with
the same format as in the ICD manual. That way you don't have to hunt
through a zillion ARChives and look for DOC files when you've forgotted
what DOITTOIT.COM does.
What ya think? It would be a heck of a project. I know a lot of the soft-
ware authors say they don't want the docs and stuff changed, but if there was
an indexed list in the back of the manual stating who wrote what, and
addresses for share-ware payments, that would be pretty fair.
It would be a huge manual probably. Maybe it could be distributed as a
DDIII file or something, since that is the closest thing we have to
a standardized PDL (page description language).

Amos,

To get the XF551 to work in fast mode with Sparta DOS 3.2d requires a slight modification of the DOS. Bob Woolley did this, I called it Sparta 3.2X or something. I don't think you can run both a US doubler or similarly modified 1050 and an XF551 in high speed both at the same time though... i could be wrong. I have a Happy 1050 and never tried it.

This file I think is on GEnie, other wise I have it on hand.

Christopher,

The Express! cartridge is a terminal program on CART like you asked.
I don't know what terminals it emulates though, besides ATASCII and
the standard ASCII. It runs about $70.00 I think. I believe there was
a Telelink cart but I know nothing about it. The 1030 modem had a
pretty horrible term program built in. But it did work in 40 columns.
To get 80 columns, you're gonna probably get the XEP80 to work with the
Express! cart.

Bill,

The XEP80 uses the E: handler only. If you try to poke some data into
what is called Screen RAM, it won't show up on the screen.
The xep80 only intercepts proper calls to E: and S: and sends this to the
monitor. You end up with two video outputs, the video from your computer,
and the video from the xep80. Most people build a switch going to one monitor
so that you see either the 40 column standard screen when it's being used,
or you see the 80 column screen when you are doing XEP80 stuff, like using
Bobterm or Atariwriter 80, or whatever.

I think the only way you could intermingle the two displays would be to
take Michael St. Pierre's Genlock board, feed the XEP80 back to the genlock
input, and then the final mixed signal could go to one monitor. One catch,
the Atari XEP80 doesn't allow you to access the 40 column screen AT ALL
when you load it's handler. The Sparta-X does. In fact one stupid thing
about Sparta-X is that Flashback half pokes to memory, half writes to E:,
so you never can see the whole picture.

No, the XEP80 does not see "pokes" to screen memory, nor is it
programmable with DLIs; it is mostly like a dumb terminal. The
supplied driver only activates when there are I/O calls through the E:
S: or P: handlers. The screen memory remains there, though, and there
is an XIO call that switches back to Antic graphics.

It does have one graphics mode, though, is it 320x200? I think so.
Monochrome only, no gray levels. It is invoked by a GR.8 BASIC
directive or an XIO, but is not supported with drawto or fill
commands; just byte data output. The only sw I have seen using it is
a routine done by Mat Ratcliff to display picture files. I don't know
which format.

I don't think there's a program that will read 128 byte sectors on an IBM
you need to have a double density drive like an US Doubler.

238. Re: 800xl vs 600xl

Source record: 113000

ARGH! Hmph! I heard, like I said before, from someone (probably a
little less knowledgable than the rest at the place) at San Jose Computer
that the xmm801 in NOT Espon compatible.. BUT!
As I will quote:

"Note: Because the XMM801's normal-density graphics function is
compaitble with Epson* printers, any screen-dump program that is
capable of dumping from an eight-bit ATARI Computer to an Epson
printer will work with the ATARI XMM801 Printer."
This is from page 45 (chapter 4: "Graphics") of my xmm801 printer owner's
manual...

So.... were they lying? I HAD PrintShop, but because I didn't know that
the xmm could accept dumps via Epson commands, I gave it back. (got it as
a present)... THEN, a couple of months later, I find my manual and read
that! Would I still be able to use printshop if I had it (or wanted
it!)?
thanks to any xmm801 users/others
bill

Sure! I'll post on the following: (if you e-mail me it, por favor.. I
always get mixed up, or turn of the computer before closing a capture!!!)
AtariBase (called internationally, Atari Corp's own bbs) 408-745-2196
ABACUS (user group..pretty famous) (San Fran) }415-587-8062
BAAUG (user group) (SF? Somewhere around there) 408-986-0215
SCCAUG (user group) (Santa Clara, again in the SF Bay Area) 408-848-6032
West Coast Syndicate (8-bit bbs! oh!.. it also uses net mail... it's run
on Carina II) 415-438-9387 (might now me >510<-438-9387)

Those, and this sig in Internet are all I usually call for 8-bit stuff..
everywhere else (here, and about 3 other bbs) are for mail... oh,
eggg-ziting!

But, please.. I think I lost that message,and this base doesn't
keep messages around for very long (they get overwritten).. e-mail the
post to me... thanks!!!

>Maybe I should try a different tack:
>Is anyone out there IN FAVOR of incorporating "Atari Classics" into EXPLORER?

I think that an electronic format would be best for a new 8bit magazine.
Reasons:
1> Dedicated to only 8bits, no ST.
2> The incorporation of programs would be easy
3> Amazingly cheap to distribute (since the resources for
such are already in place: USENET, INTERNET, bbs's)

A simple "reader" program could be used to view/handle all text,graphics,&code.
This program could easily be ported to a different machine like the MacinTrash
I'm using to write this followup.

I'm actually willing to write this program.

Other's opinion?

How about a 3d Asteroids game? Perhaps using the Sega/S-Genesis
multi-fire button controller to its advantage?
I mainly want to make something that moves more smoothly that my old 2600
Asteroids (by the way, anyone have the 4/800/xl/xe asteroids..or a
clone?)
I would have, instead of the ship stopping its rotation when you stop
turning the j-stick, it will float a little around... I also want to
make a neater looking ship.. I think I'll have it in the IRG mode (sorry
400/800ers (well.. CTIAers, actually), and use 2 sprites for the ship (4
if I make a two player mode...hmm...)
I wonder..should I do it in TurboBasic, or use Action! instead? Can
Action! programs be easily run (i.e, no runtime, or at least no cart.
needed???)
I haven't yet received Action!, because that's in the works... (I'm soo
excited, tho, too... I always wanted something more like Pascal...)
(thanks mats!)
What do you fellow 8-bitters think???

246. Cartridge Telecomm Software

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-23 23:33:23 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201232333.AA14382@smithkline.com>
Source record: 112984

There was an Atari software pkg. called Telelink, it was a plug-in ROMcart. Very high defective/failure rate. Compsult will sell a bushel-basketful for $2.00 each. You might get 10 that work.

There was an early version of the software for the MPP (Supra) 300-Bd joystick modem that was a ROMcart. Primitive, tho. Not user-friendly.

The best telecomm-ROM is the EXPRESS! cart. About equal to BobTerm in performance, altho you need SpartaDOS-X tp use it w/an XEP-80 & to get the most power from it. The Cadillac of telecom-ROM, but also expensive. I paid $65 from L&Y. Plus another $60 for SDX. The most serious defect of the EXPRESS! cart is that you still need a disk drive to use it; it opens a ch. to the drive & looks for a file of bootup/configuration parameters. No drive, no boot. Dumb.

I gave up on telecom-ROM. BobTerm on disk still blows everything else away.

247. Re: SIO2PC v3.00

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-24 00:12:03 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <53266@cup.portal.com>
Source record: 112992

As long as we're tossing around feature/function lists and wishlists
for SIO2PC, here's one Curt Wilbar (darkwing@cis.umassd.edu) recently
got me thinking about: instead of the PC pretending to be a disk drive
that an Atari CPU talks to:

```
+-------+ +--------+
| | SIO command frames | |
| | --------> | | "SIO2PC looks like a
| Atari |====================| SIO2PC | disk drive"
| CPU | SIO data/stat frames| |
| | <-------- | |
+-------+ +--------+
```

... could the PC pretend to be an Atari CPU and talk directly to an Atari
disk drive?:

```
+--------+ +-------+
"SIO2PC looks | | SIO command frames | |
like an Atari | | --------> | Atari |
computer" | SIO2PC |====================| disk |
| | SIO data/stat frames| drive |
| | <-------- | |
+--------+ +-------+
```

I would think this should be possible with only MINIMAL changes to the
SIO2PC architecture:

- hardware: has already achieved electrical compatibility between
the PC and the Atari SIO bus. (Possible "gotcha:" if being
"electrically compatible" with an Atari CPU on SIO is NOT the
same thing as being electrically compatible with an Atari
disk drive on SIO. I don't know enough; comments, you techies?)

- software: already knows how to interpret and generate SIO frames;
just enhance it to SEND what it currently knows how to RECEIVE,
and to RECEIVE what it currently knows how to SEND. Can't think
of any serious "gotchas" here, what with what the issues SIO2PC
software design has ALREADY OVERCOME.

For those who say "why bother," or who think that this use of SIO2PC
"defeats its own purpose" or whatever, I offer the following justifica-
tion:

It's all well and good to say that with SIO2PC we will be able to
store all our Atari files on a PC hard drive (partition, pseudo-disk
file, or whatever), but how are we going to get them there? The "re-
verse SIO2PC" above is an alternative to performing a read-and-write

COPY using the Atari CPU; the PC could suck data directly from Atari diskette and stuff it directly into the SIO2PC pseudo-disk area.

For those whose PCs and Atari's are not in the same location or the same room - for instance, who download from comp.sys.atari.8bit onto a PC in the office, then have to figure out how to transfer the files from there to their Atari disks. Reverse-SIO2PC would allow such people to bring an Atari drive to the office (or leave it there, in an unused desk drawer or something), hook it up to the PC, and put those files directly onto Atari diskette. I point out the immense popularity, despite flaky performance, of Atario and UTIL software which is currently the only way to do this sort of thing; a reverse-SIO2PC connection would blow UTIL-type all-software methods out of the water, would be incredibly popular, and would open up a heretofore unavailable market for sales of SIO2PC.

I'll be interested to see the commentary on this one!

I have to agree with Michael Current that we were/are SUPPOSEDLY trying to come up with an EXCLUSIVELY 8-BIT newsletter. Me, I don't care if it's six pages a month, mimeographed and stapled together and looking like hell -- as long as it comes regularly, has interesting articles, and I don't have to wade through four tons of ST bullcrap to FIND the 8-bit stuff.

And, I ALSO have to top what's-his-name who writes from Australia that he has never seen an Atari Explorer magazine. Well sir, I live in Rochester, NY -- home of CSS and Bob Puff -- and _I_ have ALSO never seen an issue of Atari Explorer in all the years it has supposedly been published.

You don't have to be in Australia to never hear a peep out of Atari.

My older sister has three children (ages 5,3, and 1) ... and her oldest kids both love to play on my ST and/or 8bit when they come over and visit. Since they don't have any type of computer/video game of their own at home, I have been considering giving them the 8bit. I mean, these guys love it so much & I think they really should get used to computers now so they're not afraid of them when they get older.

My question is this...do you think it matters whether they get some ancient computer like an Atari 800...or would it be better to give them something newer/better...or perhaps something older/cheaper like a 2600?

I have doubts on whether they'll understand how careful they would have to be with the machine...especially floppies, etc...

RE: the continual trickle of people suggesting someone put together a new
8-bit electronic newsletter

Do you read Z*Magazine?? Do you contribute to it??

Z*Magazine is JUST FOR 8-bit ATARI USERS. And it is STILL BEING PUBLISHED.
I think Ron Kovacs deserves a lot of credit for not giving up on the concept.

If people have a better idea for an electronic forum that Z*Mag, I think
they ought to contact Mr. Kovacs and offer suggestions for change, not
suggest the creation of a competing electronic newsletter. We need to pool
our resources, not divide them.

And as we thought we beat to death before, there are all sorts of reasons why
we need a PRINTED forum for the 8-bit Atari. Only a small percentage of
8-bit Atari users are online in any way, remember? A printed magazine will
have the possibility of reaching EVERY 8-bit Atari user.

I think the Atari Explorer Proposal is a good option for 2 reasons,
1. The Atari commmunity cant afford to loss another periodical. And
incorporating a *STRONG* [Double bold hot blue strong there] 8bit
presence is a good way to shore up support for AE. If AE had
that type of coverage, Id subscribe instead of buying off the shelf.

2. I agree with the premises in the proposal, putting together a
magazine that will reach its target audiance is serious work.
AE has the reach. [But unfortunately AE has never been my first
choice for Atari News and General Information. AE IMO has
always suffered from that problem and thats why Ive never subscribed.]
If AE can be made into more of a useful magazine, more like Analog or Antic
(Analog always blew Antic away) Id be a 10 year subscriber.

I'm not sure it it's still being sold or not, but there is the Express Term Cart. It's a great term program, and has a protocall called L-modem. This protocall caters to PRO boards.

Basicly, if you set your parameters for auto L-modem downloads, all you have to do is locate the file you want, and hit 'D' for Download. The bbs and the cart will do the rest. You don't even have to type in a filename! Now that I think of it, American Techina Vision still sells it, but it's kind of expensive.

Well, for one, I don't have long distance (sorry 'bout that)! Anyone else who does can get right on my ststem and get these utilities, and even check out the docs that are in a seperate file sig that I have online. Believe me when I say that with all of the people who have forgotten about the Atari 8-bit, everything I get, I make it available to the users!

By the way: Even with how I have my system set up, there are ARCed disks full of SpartaDOS utilities, as well as individual ones. With a special utility I have online, a user can use keywords to locate files, and therefore has a easy time of locating any type of file. It only takes 1 to 2 seconds to locate any of the 2000+ files I have online.

I have kicked my Atari 800 and 300-or-so games back to life. Shadow World (a game) interests me. What do I do when the space globules land? There seems no way to get rid of them and no way to progress in the game from that point.

Well, I remember that game Xagon...I have it on disk around here somewhere...
I still use my 8-bit a few times a week, heheh I tend to return to what I
grew up using... well since the last 70's early 80's that is...hahah it sits
happily next to my Mac II and my 386 running Qnx OS... my 256k 800xl is a
great system... I have a US Doubler installed in my 1050, and never had a
problem with anything on this system..hahah it has been in use for at least
10 years? or so...

I feel that "Atari Classics" in the Explorer would go a lot further
than an independent magazine. (I have never heard of CN or AIM except in
this newsgroup, I wonder how many other people out there with 8-bits
feel the same way.)

The fact that I can go down to Waldenbooks or B. Daltons and pick
up an Explorer is also a very positive factor.

Later.......

|>
Here, Here! I couldn't have expressed it better myself. I'd take the cheapest, crappiest fanzine ever if it was all 8-bit and had good material. And I think this message base alone proves there is still enough good material that can be written about the 8-bits.

Also, I found that EXPLORER proposal to be EXTREMELY condescending. First, it says 8-bit owners are TOO CHEAP to support a magazine. Secondly, it says that 8-bit owners don't have the intelligence or know-how to enter the publishing arena, as if the track record of ATARI EXPLORER was anything to crow about on how to put out a magazine the right way. Spare me. I think we could do better than the few crumbs they were willing to toss our way in that 'proposal'!

From: tgreen@iastate.edu
Message-ID: <tgreen.696265225@vincent1.iastate.edu>
Source record: 112906

I just finished the sio2pc interface for atari <-> ibm. It's
pretty cool. I used an broken MPP-1150 printer interface for
the connectors & box - looks almost professional. I don't
have v3.00 of the software yet, just v2.12. Chris suggested
the following:

In <53266@cup.portal.com> Chris_F_Chiesa@cup.portal.com writes:
[...]
> +--------+ +-------+
> "SIO2PC looks | | SIO command frames | |
> like an Atari | | --------> | Atari |

> | | <-------- | |
> +--------+ +-------+

> I would think this should be possible with only MINIMAL changes to the
>SIO2PC architecture:

> - hardware: has already achieved electrical compatibility between
> the PC and the Atari SIO bus. (Possible "gotcha:" if being
> "electrically compatible" with an Atari CPU on SIO is NOT the
> same thing as being electrically compatible with an Atari
> disk drive on SIO. I don't know enough; comments, you techies?)

You need to reverse the direction of the command line - instead of the
PC receiving command, it would be sending it. Could maybe do this
by adding some switches, or just build another one - parts for mine
was only about $15.

> - software: already knows how to interpret and generate SIO frames;
> just enhance it to SEND what it currently knows how to RECEIVE,
> and to RECEIVE what it currently knows how to SEND. Can't think
> of any serious "gotchas" here, what with what the issues SIO2PC
> software design has ALREADY OVERCOME.

I really wish Nick Kennedy had done it in C - I know C much better
than assembly on the PC. However, I did look at the code a little,
and I might be willing to give it a try. If I do, I'll probably
rewrite a bunch of it in C. One thing you might not have noticed is
how Nick assumes memory on the PC is his to use - he doesn't "ask" for
it like he's supposed to. This could be very dangerous, IMHO. Other
than that, the software looks pretty good.

I think an alternative to changing the hardware is to improve the pc
software for transferring files from pc -> atari disk image & back.

I'd like a program that would allow moving files freely between the pc file system and the atari disk image files. This would be almost as good as Chris's idea, since copying files from the sio2pc image to a real disk isn't hard to do.

Of course, I probably don't really have the time right now, but who knows.

Todd Greenfield

Source record: 112918

I'm against putting Atari Classics (AC) into the Explorer. IMO, the Explorer is just laid back and empty journalism. The reviews always give the thumbs up to every product; the information is often outdated or printed way too late; and, as you'd expect from a house organ, it gives the impression that all is rosy in the Atari world. And what the heck is the intended audience? ST articles, reviews of Lynx and 7800 games, stuff about the Portfolio, some 8-bit coverage--absolutely no consistency. Plus it is published a bit too sporadically for my tastes.

Everyone involved in this newsletter project should get a subscription to _The 2600 Connection_, a small newsletter dedicated solely to the ancient Atari 2600 VCS. It is slim (10 pages), but very well laid out, and--this is the important one--somehow manages to give the impression that there is vitality and excitement about the system. I don't know how they do it, but I look forward to that newsletter with the same anticipation I used to have for ANALOG. And they must be doing something right, as their subscription base is growing rapidly--they were given a significant plug in the magazine that started this discussion, Atari Explorer.

I think that something small, semi-professionally done, and with EXCELLENT AND INFORMATIVE ARTICLES AND WRITING would really take off for the 8-bits. AIM is okay, but I find that most of what they print is complete fluff, not to mention that it doesn't look much better than your average user group newsletter (which is what it is). I think someone with access to (and who's very adept with) a some quality desktop publishing software, a laser printer, decent scanner, and WHO CAN WRITE would be able to pull this off.

Believe me, if I had the above equipment, and more time than I currently do, then I would do it myself. And if the income from subscriptions and advertising covered more than printing costs, allowed me to pay contributors, and had enough left over for me to get by on (just dreaming here) then I would QUIT MY JOB AND WORK AT IT FULL TIME. Dedicated? Hell, yes. (And probably very stupid.)

Is this what you were looking for, Ben?

You'll love Action! After you get used to a word processor type editor
for programming you'll use it for everything. Takes a while to pick-up,
but the return is great. Programs will run at about 1/2 of pure ML speed
but only take 1/10 the time to write. There's a public domain run time
package that'll make stand alone programs. If you need it I can U/L it
on one of our local boards like Atari Base.

Again I agree with Michael. I'd probably have read a lot more than the two or three issues of Z*mag I've ever seen, if they were in printed, rather than electronic, form. I've never had the luxury of zapping things in via FTP and right straight out to an employer- or university-subsidized printer, and Z*mags are LONG and take a LONG time (in my opinion) to download.

Also, for what it's worth, I found Z*mag to be overly full of Atari-Corp.-bashing and other "political" news (I don't care, for instance, where Bob Brodie happens to be at any given time), and lean on programming/tech/useful stuff. I.e. I don't want to spend MY paper and MY printer ribbon on it... I *would* pay a small fee to receive it already printed and stapled on a monthly or similar schedule. Not a BIG fee though.

Call me Mr. Tightwad...

>How about a 3d Asteroids game? Perhaps using the Sega/S-Genesis
>multi-fire button controller to its advantage?

I'm a 3D fanatic myself. You could also use the Sega 3D glasses to do TRUE 3D display; page flipping etc. is perfectly suited for this. I've been slowly piddling my way toward an Atari joystick-port adapter and software driver for exactly this plug-in, for a while now... I move slowly and with great ponderosity (probably because I spend so much time HERE instead of actually DOING things, heheh)...

>I mainly want to make something that moves more smoothly that my old 2600
>Asteroids (by the way, anyone have the 4/800/xl/xe asteroids..or a
>clone?)

I have the cartridge and I also remember seeing it pirated as a disk file back in the dim dark past...

>turning the j-stick, it will float a little around... I also want to
>make a neater looking ship.. I think I'll have it in the IRG mode (sorry
>400/800ers (well.. CTIAers, actually), and use 2 sprites for the ship (4
>if I make a two player mode...hmm...)

Sounds like you're a 2600 programmer??? Is that possible??? I might buy a 2600 if I found I could actually program it...

>I wonder..should I do it in TurboBasic, or use Action! instead? Can
>Action! programs be easily run (i.e, no runtime, or at least no cart.
>needed???)

Action sure has the fastest speed-of-execution of any language I've tried on the Atari. I've tried Atari BASIC (of course), BASIC/A+, Turbo BASIC, Frost BASIC (same thing), Action!, and Kyan Pascal. I have, but haven't gotten around to trying, CC65, Draper Pascal, and a couple of other odds and ends... Of course there's always assembly language but that's not as easy to write as these others...

>I haven't yet received Action!, because that's in the works... (I'm soo
>excited, tho, too... I always wanted something more like Pascal...)
>(thanks mats!)
> What do you fellow 8-bitters think???
> phbill

I think this was a very interesting message, that's what I think! :-)

Source record: 112912

I just recently obtained (through here mind you) an XF551 drive!
Wonderful piece of smallishness. Still...PROBLEMS ABOUND!!!
Here it is all jumbled and confused:

The Drive Mech that came with the unit (I'll call it the Oringinal Mech: OM)
Works fine with Single sided single density. However!!!!!! With any double
sided double density or even single sided for that matter the drive crashes.
That is...it formats slow...then Naks then if lucky DOS says do it again..
then it might work...Slow..Nak..slow...Fast. Should be Slow...Fast according
to Mr. Puff. He don't know the answer to this one either guys.
So what? Well...Good ol' me happend to have a Mitsushita mech (JVC/PANASONIC)
(I'll call it the New Mech: NM 8-). Ok...when pluggin this in to the
XF board the drive works GREAT! FANTASTIC! NO ERRORS!!!! NO MATTER WHAT!!
Well you say...must be a bad OM. (Pun) Well then why when I put the OM
in an IBM/Compatible..it works great fine!! no prob!!! even if I run
drive diags on it!!! Ok...so why the __LL doesn't then OM work in the
XF???? Why bother? Well because the NM doesn't fit in the case and
the connectors aren't long enough!!! Sorry..but I did pay $75 for the
darn thing and would like the mech to atleast function partially on the
XF.
Andrew

Source record: 112927

Sounds like a good plan to me - I think it'd be foolish to turn down an offer of free printing and distribution with little or no editorial restriction. Use electronic medium as a method to inform people that this new expanded 8-bit section exists in Atari Explorer, but don't overlook the 80% of 8-bitters who don't actively engage in modem access.

To reject this offer because AE is run by Atari Corp and Atari dropped the 8-bits would also be chopping off your nose to spite your face - what's important is doing whatever possible to ensure success of the 8-bit publication, and I don't think you have any better chance of success than to accept AE's offer.

Attention Atari fans! I have an Atari 400 for sale, complete with several accessories:

Atari 400 console
GTIA (newer) video chip
3rd Party 48K board
410 tape drive
ALL cables, power boxes, etc. (sorry, I don't have the manuals)

Software:
Cartriges --
Gorf -- Star Raiders -- Speedway Blast -- Mountain King
Squish 'Em -- Kickback (soccer) -- Rev. A BASIC

Tapes: Too many to list. Around 50 of them, many of which I have no idea as to their contents!
Among them . . . Livewire (Tempest clone) , Galaxian, Frogger clone, Juice!, and Blue Max, just to name a few.

The whole setup is fully functional and in great condition. I'm not sure how much the thing is worth, but I'll say around $40 + shipping or best offer.

Thanks . . .
John Carmack

Every notice that the color of your status line changes every now and again?
Thats because there is this little beacon/ship thingy flyiny very low to
the ground. You must drop down close enough to the thing to have it run
into you. Your ship will glow then. NOW! you must fly your ship to those
landed pods and just hover ever so slightly above the opening that is
firing all that stuff into the air. You will plug it. It will destroy itself.
Also...play this game with a Translator (800OS) so that it doesn't lock up
on the XL/XE's.
Great Game though! Very great...get two players going after one another!
Try it drunk.
8-) Andrew.

281. Atari 8bit software for sale

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-24 23:35:02 UTC

I have posted the first of two listing of 8bit software I have
for sale to misc.forsale.computers. All the mentioned items were
tested prior to the post. Please take a look!

Thank you,

Rick

282. Explorer Proposal

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 00:11:13 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201250011.AA17224@smithkline.com>
Source record: 112926

From: PHVAX::POEHLAND 24-JAN-1992 19:06:09.42
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: Explorer Proposal

Let's see, I count 1 FOR, 3 AGAINST, & several OBTUSE, responses to the
proposal by Explorer to incorporate Atari Classics into slick mag media.

Do I sense a pattern developing here?

Well now, this is more like it. But there's still a few hundred of you guys
out there who haven't spoke up. A little MORE noise, if you please.

Wassuh mattuh? Bashful? Cat gotcher tongue? This is no time to be shy!!
This is YOUR forum. Give YOUR opinion. Don't let the future happen by default!

If anyone would like to see the text of Mr. Jainschigg's proposal again, just
let me know, I'll upload it again to this newsgroup via CSA8.

Does The Alchemist have an opinion on this? YOU BETCHA!! I've gone over the
text quite thoroughly & have a response for each paragraph of it. However,
insofar as I am a player in the game I do not wish to give the appearance of
influencing opinion one way or another. Therefore, I shall not express myselfuntil there
has already been deposited into this Digest a sufficient number of
responses to make clear to an impartial observer what the majority opinion
is, exclusive of my own.

Hers's the deal: you folks all gotta tell me what YOU think first.
Then I'll share my views with everyone on the Net. Fair enough?

- BEN POEHLAND

283. Impressions of Explorer Magazine

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 00:15:55 UTC

Message-ID: <9201250015.AA17231@smithkline.com>
Source record: 112928

Colin Hunt asked for some input on Atari Explorer Magazine (AEM). I don't have a copy here in front of me, in fact haven't even looked at one for over 6 monthsbut will try to convey my general impressions.

I'm surprised at the relative lack of familiarity with AEM. A freebie sub application was included in just about every Atari product I ever purchased. It's a slick mag, averaging 70? 80? pages/issue. LOTS of ads & hype for all the latest products from Atari Corp. (which, these days, means ST/TT extravaganzas). Which isn't surprising, since the magazine's operational budget comes directly from Atari Corp. I think it would be fairly accurate to characterize AE as Atari's official print medium mouthpiece.

AE was originally HQ'd on the East Coast, New Jersey I think. About a year ago, around the time porn sleazebag Larry Flynt was pulling the plug on ANALOG, Tramiel demolished Explorer. Pretty much the entire staff was fired, & the magazine was surreptitiously moved to its present location in California where Massuh Jack can keep a closer eye on it. Prevailing opinion at the time held that AE had gotten too big for its britches (TRANSLATION: they printed some editorials critical of Atari's management).

In the past year the magazine has risen somewhat shakily to a more-or-less regular publication schedule under the helm of John Jainschigg. It was quarterly for awhile, then seems to have stepped up, I belive it is now bimonthly. 8-bit coverage, which was already on the wane before the shakeup, has essentially vanished from the present venue. Despite people's claims not to have seen it, I have never had a problem locating on magazine racks in various bookstores in my local area (30 miles west of Philadelphia). Places like Waldenbooks, B. Dalton, Encore Books, etc., in shopping malls. (Quite often, right next to AIM on the shelf.) I have a vague recollection Bob Brodie had a column, or some sort of articles, in AE, but never a subject that piqued my interest. If there is one central theme associated with my impressions of AEM, it is that I can't recall ever reading anything in it that was memorable or useful. Which is probably why I never subscribed. The final year of the old regime was said to be quite good as the old staff grew more bold (1988? 89? or so) but by that time I had given up on them.

Atari has apparently charged Jainschigg with responsibility for making AEM financially self-sufficient in 1992, a theme close to the surface of John's existence as he repeated it a number of times in the conversation during which he was introduced to me by the publishers of AIM. John also told me at that time he expected AE to go to 7 issues in 1992.

It has been pointed out to me by several people that AIM's 8bit coverage has declined also over the past couple years, a fact which cannot be denied. But AIM at least presented a few interesting tidbits- buried amongst the ST stuff, of course- sufficient to attract my attention.

Explorer does not offer a monthly software disk, 8bit or ST, that I know of.

Colin, I know this isn't much to go on, but it's the best I can do.

If anyone else would like to add to this, or offer their opinions, please do!

- BEN POEHLAND

In article <92023.131247JJMCWILL@MTUS5.BITNET> JJMCWILL@MTUS5.BITNET (Jeff McWilliams) writes:
>I think the only way you could intermingle the two displays would be to
>take Michael St. Pierre's Genlock board, feed the XEP80 back to the genlock
>input, and then the final mixed signal could go to one monitor. One catch,

Jeff,
Could you post information about the genlock board you mentioned above?
Long before the current ranges of 16 and 32-bit computers were out, before there was a genlock for any personal computer, I wanted one for my 8-bit (though of course I didn't know what one would be called). Any information on capabilities, pricing, and availability would be appreciated.

Source record: 112933

I also must agree that going with the Explorer is a bad mistake. It has always been and always will be an ST magazine. Let alone...I can't find a copy anywhere.
This is supposed to be an all out 8-bit only magazine. Let's submit articles and the like and run the thing off a xeroxer and get it moving. The subscription base will grow...mail information to all the Atari boards you know plus Genie, Compu-Serve, and netwise. I would be willing to pay $3.00 and issue even if its only ten pages of light ink.
Perhaps you should "set" up people to perform certain tasks....that is to say have people designated to be an "Editor" of each major topic. Such as Hardware Upgrade Editor...Bussiness/Applications Editor... End user Editor, Feedback Editor...I'll gladly spend time sorting through mail and information from others to piece together and upload to the final productions staff.
Hey...I like this.....I could be a writer for once! This is great! There are so many weird upgrades and system tumors done around college here to the 8-bit. I would gladly interview and writeup stuff for the magazine.
Shall we GO with this independent USER only magazine? Hell, I'll do it myself on me good ol' xl and mail it to myself right now to make me feel better.

Andrew K. Heller

286. REPLIES

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 03:39:26 UTC

Message-ID: <92024.223926JJMCWILL@MTUS5.BITNET>
Source record: 112937

Michael Kieras was asking about the genlock board. This is a hardware
project that Michael St. Pierre made and published in the SLCC
journal. It appeared in issues November and December of 1991.
It doesn't specify which computer it is for, but I THINK it is
for the XL and XE machines. Anyone interested in reprints
can contact the San Leandro Computer Club at ..

P.O. Box 1506
San Leandro, CA 94577-0374

Tell 'em Jeff McWilliams sent ya.
The articles includes schematics, and the PCB artwork if you
know how to photo-etch PC boards. I believe Bob Woolley also
auctioned a couple off at the latest meeting. Wish I lived in
California!!

Dennis wanted to know about whether he should let his children
use the computer. I think that's Great! The Atari 800 is a rugged
machine, built like a tank. As long as you can teach them how to
properly use the disk drive and such you should have little problem,
kids seem have the ability to pick up computer skills betten than
older people. My daughter is two, and she always tries to sneak into
my chair and pound away on the keyboard just to watch the cursor
go by on the screen and hear my keyboard click. But two is too young,
I don't need her dumping her sippy cup of fruit juice on my keyboard.
Many places still carry lots of educational games for little kids
that are fun and help them learn at the same time. I suggest looking
up American Technivision, B&C Computervisions, and BEST Electronics
for dozens of titles.

Amos,

The XF551 in fast mode isn't as fast as the US doubler. In double
density it will sound something like it is reading single density
disks. You have to format a disk in XF551 fast mode also for it to
work properly. Use 3.2d XINIT, and when it asks for US DOUBLER
sector skew, reply NO. The newly formatted disk will be fast.
I don't think single density disks will benefit from this fast mode
at all, I am vague as to where learned this, if it was from the
original docs for that BASIC program you mentioned, or where.

I would surely love to visit your BBS, but as a college student,
I can't afford long distance either. I had wrongfully presumed that
since you could post to the net, that you had access to the
Atari.archive.umich.edu and could put stuff there. Is GENIE a local
call for you? I don't think they charge for uploading stuff.

Andrew,

Your XF551 experiences are certainly perplexing. I own two of them, one is standard configuration, the other has been modified as a 3.5" 720K drive from the Innovative Concepts upgrade. The mechanisms they use are IBM standard half height drives, I cannot understand why your other drive will not mount in the XF551 case. When I put in the Sony 3.5" mech, it came with a kit of rails you attach to the drive to mount it into a standard 5.25" bay, and it worked fine. Also, the mech. that I pulled out of the modified XF551 went into a standard Floppy drive case & PS, with a cable running back to the modified drive. Flipping a switch gives me access to the 5.25" mech again. My point is, the mechanism size is STANDARD, you must have a weird new mechanism there, perhaps a 1/3 height?

Source record: 112935

To put in my two cents worth, I don't personally care for explorer either.
Like others have said, the publication was never really big on 8 bit articles.
There was never anything about the 8 bits to sink my claws into. It was all
ST hype, and now Portfolio and Lynx as well. There were a few program listings
back in the old days, but they were silly demos and stuff, nothing even close
to what you could find in Analog or ANTIC when they were around.
The only thing ever useful in the publication was a few mentions of new
products for the 8 bits in the New Products section of the magazine.

When the Bosses at Atari kicked out the editorial staff because they didn't
like what they were saying about Atari, what did that communicate to
the reader? That the magazine depicts the Atari world as a
tropical paradise no matter what. That's not journalism folks, that's pure
hype, like the 30 minute commercials that air on TV late at night.
Atari Explorer has an 8 bit editor. Why hasn't he done anything to
help out the 8 bit community beside sit on his duff? Perhaps he doesn't
really care. And maybe the only reason John is making this offer to the
8 bit people is to rake in more subscribers. Did he say he was concerned
for the 8 bit community? No he said we are cheap, and waved cash in our
faces saying Lookie, Lookie, big money if you just get these people to
subscribe to my magazine, and make ME look good to the Tramiels.

Compare Atari Explorer to Atari Interface Magazine. AIM is dedicated to
Atari. It shows. Recently they asked subscribers if they wanted additional
money spent on improving the look and content of the publication, or on
going from third to second class mailing. People voted for improvement
of the magazine. Clearly the Rayls are concerned with what their
readers actually THINK. They actually give a darn.

Additionally, they are not an entity designed from the beginning to do
nothing but spew forth pro-Atari garbage at its readers. AIM is an
independant magazine. That means that if you think Atari bites dirt for
dumping us 8 bitters, you can say so without fear of Jack Tramiel hitting the
CENSOR button. I don't think I have ever heard the Rayls call us CHEAP
either.

Additionally, AIM has the support of 78 users' groups. Why would 78 different
users' groups support a magazine it they didn't all think AIM was doing a
good job?

AIM offers disks each month, AE doesn't.

It is senseless to think that by joining up with Atari Explorer the
8 bit community will be better off. It will be no better than
before. Atari 8 bit articles will still compete for space with
Atari ST/TT, Portfolio, and Lynx machines. Articles would be

carefully scrutinized to ensure no criticism of Atari was contained
within them. Vendors would have to compete for advertisement space
beside all the vendors for the other machines made by Atari.

********** Atari Classics Campaign Update **********

I am currently waiting to send 98 info kits out in the mail.
The materials are being shipped from Ben's place to mine, where they
will be assembled and mailed next week. Letters are starting to
come in, as have responses both on the Internet and on GEnie.
Also on the way are more mailing lists compiled by Ben himself.
Vendors are jumping up to support the campaign, including
BEST Electronics and C.S.S.'s own Bob Puff.

After the first couple hundred kits go out next week, Kit-Paks
will start being assembled and shipped to Users' Groups to be
distributed to their 8 bit members.

For those of you who have replied to me with mail addresses,
an info-kit will be in the mail early next week, unless Houghton is
destroyed, bombed, or receives 100 feet of snow. For those who havn't
sent me their address, you are missing out on the only chance to keep
the Atari 8 bit community alive, and it could be your vote that
shifts the scales of Fate in FAVOR of the 8 bit community.

```
>
> What about size and speed of MyDOS as compared to AtariDOS 2.0? Does MyDOS
> support RAMdisk? Will it run on my 800?

Well, MyDOS is a little bit bigger, but I don't notice it. And yes,
there's even a SetRAMDISK command on the main menu. (you can also
configure drives, such as HD, non-Atari drives, etc. etc.)
It's pretty nice.. I like the SubDIRectories, but I barely use them!
(took me forever to get even close to making anything to handle SubDIRs
thru Atari DOS... then again, I was using BASIC, and had most of the
trouble with the CLI, not the file management.. i.e., having various
ways to use the command DIR, or CHG, etc.etc.)
You should get it! Pretty neat..
bill

BTW, on BobTerm's title screen, it used to say "try mydos 4! It's
great!".. now that I have it, BobTerm doesn't say it, it knows! :)
(made by the same guy...)

This doesn't sound very appealing. While I am unable to participate in this campaign, I would oppose it going to part of Atari Explorer as outlined in the previous letter to Ben Poehland.

If the 8-bit community is going to get its own magazine, then it had better be ENTIRELY 8-bit, IMO.

292. Atari 8-bit magazine as part of Atari Explorer???

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 03:48:15 UTC
From: esok@everest.ee.byu.edu
Message-ID: <1992Jan25.035027.19310@caedm.byu.edu>
Source record: 112938

I don't like what the person from Atari Explorer outlined for the proposed
8-bit magazine. 8-bit users need their own magazine, IMO.

293. Attention Atari 8 Bitters!

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 04:24:30 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92024.232430JJMCWILL@MTUS5.BITNET>
Source record: 112934

Heads Up, Atari 8-Bitters!!

This Is For YOU!

Beginning 1992, the Atari 8-bit computers- and the community of
USERS who still cherish these machines- have been officially discarded
by Atari Corporation.

BUT WE REFUSE TO ROLL OVER AND DIE AT ATARI'S COMMAND!!

We believe there are enough of us left to pursue our 8-bit
interests independently of Atari Corporation.

Would you like to see a common forum in which users, developers,
and vendors can communicate? A print medium wherein advertisers can
be assured of reaching their intended audience, and where users can
look with confidence for information about new products? A user-
oriented publication to fill the void left by the collapse of ANTIC
and ANALOG?

My name is Jeff McWilliams, and I'm a dedicated 8-bit user. I
want to present the Atari 8-bit community the chance to gather under
one publication dedicated exclusively to the Atari 8-bit computers. A
magazine that will unite our community and give it the strength it
needs to survive. A forum where users can ask tough questions and
read unvarnished product reviews. A magazine whose ads will be almost
exclusively from 8-bit vendors.

I propose a write-in campaign to Atari Interface Magazine, asking
for a separate, exclusively 8-bit magazine called "Atari Classics".
Atari Interface Magazine already has a strong presence in the Atari
community. For several years AIM has been a combined ST/8-bit magazine
whose publishers have indicated a willingness to support the Atari 8-bit
community as long as interest warrants it. NOW is the time to ask them
for our own magazine!

As Campaign Manager, I will act as the focus for this effort. Now,
you might be wondering, "WHAT CAN I DO TO HELP?". That part is EASY!

Just SEND me your NAME and POSTAL MAILING ADDRESS. I will mail you
a FREE Information Kit describing our goals in greater detail. Included
with the Kit is a stamped postcard on which you can express your
interests and willingness to subscribe to an exclusively 8-bit magazine.
(Or, if you disagree with our approach, you can just toss it away and
that will be the end of it- BUT WE DON'T THINK YOU WILL!) You'll also
be invited to indicate your willingness to PARTICIPATE in the magazine
DIRECTLY by being a regular columnist, editor, or just writing about a

special project you did or review a product you used.

Ben Poehland, the former 8-bit Editor of Current Notes Magazine, is fully supporting this campaign and has offered to donate his services to "Atari Classics" when repairs to his fire-damaged home are completed later this year.

The cutoff date for receiving the postcard responses is:

MARCH 31, 1992.

If by that time I have received 500 positive commitments via postcard, they will all be sent to AIM along with a petition requesting the formation of our proposed exclusive 8-bit publication "Atari Classics". If I receive less than 500 replies, then we will know that the 8-bit community has indeed become a lost and hopeless society.

TIME IS RUNNING OUT. THIS MAY BE THE LAST OPPORTUNITY YOU WILL HAVE TO KEEP YOUR MACHINE ALIVE AND SHARE EXPERIENCES WITH FELLOW USERS.

IMPORTANT!! Only the OFFICIAL Campaign postcards will be accepted! Those responding by other means will be mailed an Information Kit with which they can register their official response. Regrettably, due to limitations of time and cost, the Campaign will be restricted to addresses in the USA only. However, unofficial responses from outside the USA are welcome and will be included in the final count.

PLEASE DO NOT SEND MONEY! If anyone wishes to assist the Campaign, they can do so by posting this release in its unmodified entirety to other on-line services, BBS's, usergroups, friends, and vendors. Additional assistance can be rendered by gatheringnames and addresses of Atari 8-bit owners and furnishing them to me so I can mail them an Information Kit.

If you're REALLY SERIOUS about keeping your Atari 8-bit classic computer alive, be sure to obtain the Information Kit and return the included postcard appropriately filled in. Every day more 8-bits get stashed in attics or closets, or simply thrown away. Atari's Classic 8-bit computers- the 800/XL/XE machines- are every bit as useful and productive today as they were in the heyday of 8-bit technology. They deserve a better fate than the local landfill!

Hmmm... I don't remember what version it was that I first built, but SIO2PC is up past revision 2.17. I would get a new version of the docs if I were you (although no mention was ever made of there being a problem with the hardware circuit - all revisions have been to the software...)

Sure, you could 'share' your laser printer with the Atari, but it wouldn't be any different than simply hooking up a laser printer directly to the 8bit... You would still need drivers and software that could take advantage of the laser...

Well, putting our 8bit-Magazine-To-Be inside of Explorer obviously has advantages and disadvantages. On the up side, we'd get a nice glossy mag to look at, with our costs being lower than would otherise be possible. On the downside, we are 'dependent' on this magazine - it's up's and downs will mean possible interrupted service to our 8bit community.

If at all possible, I would say 'nay' to the idea of a merger.
Also - someone brought up a good point regarding ZMAG. I still read it when I can find it, but it is very difficult for me to get. Why isn't it distributed on the internet? I would hope that we could distribute most of it's contents in our own mag.

> our resources, not divide them.

Thanks for the message Michael, I have sent it to Ron for his persual. If
any of you want to contact the Z*MAGAZINE / Z*NET crew on the nets here
is how it is done via our Z*NET gateway..

Address on the Nets : kcbbs.gen.nz!status!znet or
znet@status.kcbbs.gen.nz

On your first line of the message put a For: line like this ..

For: Ron Kovacs or John Nagy or Jon Clarke or whatever.

It will then be sent to either Genie,Fnet,Fido or direct to Rons BBS
in NJ (Z*NET BBS) depending on the quickest route.

Look in the next message for other address's as well.

> ... could the PC pretend to be an Atari CPU and talk directly to an Atari
> disk drive?:

It would be very simple to have SIO2PC converted into an Atari device controller for PC's. (Why not hook up your 1020 plotter, or XM301 modem, etc. to your PC as well??)

As someone else mentioned, Nick's code is pure assembly language. If and when I ever get the time, I'd like to write a general "device driver" for SIO2PC that will let you talk to any Atari device using your PC. I ply won't be able to START such a project until the end of April, though... :(

From: omf@jab.tucson.az.us
Message-ID: <k2R4eB1w164w@jab.tucson.az.us>
Source record: 112949

I just downloaded the demo-disk from the '91 Atari Expo and it's pretty impressive. The music in it is some of the best (if not THE best) I've heard come from my good ol' Atari. So, anyway - I WAS going to make a point - whomever these hackers are who are making all of these great demos (apperantly many are from Dutch-speaking contries...) should consider teaching their techniques to the rest of us. I assume these are 'trade-secrets' to a certain extent, but the information would benifit the community immensely. I'm sure this one demo would impress everyone at work sitting around their 386's with VGA's ...

Hmmm.... anyone listening?...

The original version of supunarc was written for SpartaDOS, the only difference is like two bytes or so that TELL MyDOS where to start executing code. SpartaDOS automatically assumes the Load address is the same as the Execute Address. Well it's something like that anyway. You need the other version, for MyDOS and AtariDOS. Sometimes it's called SUPUNARC.D25.

>bashing and other "political" news (I don't care, for instance, where Bob
>Brodie happens to be at any given time), and lean on programming/tech/use-
>ful stuff.

One thing I *don't* want to see is a magazine full of bitching about
Atari and all sorts of gloom and doom nonsense which ANALOG and such
were resorting to in their last few years of publication. Once you've
been orphaned, the pressure is off and jou can just enjoy things.
Something I've noticed over the years is that the users of discontinued
machines seem to have a whole lot more fun than those people trying
to stay on top of things in the PC world..

About the Explorer: someone mentioned that being available in the
big bookstore chains would be a plus. Well, it would be if the
explorer had any kind of regular schedule. Sometimes it's monthly,
sometimes bimonthly, sometimes quarterly. And on at least three
occasions they've printed editorials to the effect of "we've been
kind of out of it in the past, but now we're back!" I haven't been
able to find an issue for four months now. I think this is my
main bone to pick with them.

309. Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 18:30:53 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1992Jan25.183053.8638@usenet.ins.cwru.edu>
Source record: 112855

```
Frequently Asked Questions - comp.sys.atari.8bit Revised 25-Jan-92

This is the very first edition of the comp.sys.atari.8bit FAQ. Please don't
hesitate to send any and all additions/corrections/comments to me at any of the
addresses appearing at the end of the document. -Michael

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is this Usenet newsgroup, dedicated to the free
exchange of information pertaining to the 8-bit Atari computers: the 400, 800,
1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit,
collected and e-mailed to subscribers on the Internet who do not have access to
Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not
implemented at this time. Thus, one should NOT post to
Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear
on comp.sys.atari.8bit.

What is atari.archive.umich.edu?
atari.archive.umich.edu is the anonymous FTP site which contains many
files for the 8-bit Atari computers. Those with full Internet access can FTP
to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in
your e-mail address as your password. Now type "cd atari/8bit" to reach the
8-bit directories; there are three subdirectories within the 8-bit directory:
cc65, new, and sio2pc.
Users may upload new files to the atari/8bit/new directory. When
downloading or uploading to/from atari.archive, be sure to have file-type set
to BINARY when transferring binary files (.arc, .com,).

What is BART?
Some persons have Internet e-mail access but do not have FTP access.
They, too, can access the atari.archive library through the BART mailer.
BART's address is atari@atari.archive.umich.edu. BART automatically UUEncodes
binary files before e-mailing them to you. For complete instructions on using
BART, send a message to BART that says nothing but this:

help
```

Even if you do not have FTP access, you can still upload new files to the atari.archive. Send new uploads (UUEncoded, if binary) to J. Dunning at jrd@stony-brook.scrc.symbolics.com.
While in the past UUEncoded binaries have been posted directly on comp.sys.atari.8bit, the practice is discouraged because many people, especially Info-Atari8 Digest subscribers, find it frustrating and costly both in time and money to have to scroll through long UUEncoded messages to find the postings they can actually read. Please e-mail UUEncoded binaries to J. Dunning instead.

What is Z*Magazine?
Z*Magazine is the original Atari online magazine, with over 200 issues published so far. It covers the 8-bit Atari computers exclusively.
There is no organized method of receiving Z*Magazine over the Internet at this time. Recent issues have been uploaded to atari.archive.umich.edu/atari/8bit/new, and are also available on the Cleveland Free-Net. To contribute articles to Z*Magazine, send your articles to R. Kovacs at 75300.1642@compuserve.com.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board system. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can telnet (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG members-list are automatically members of the official Atari users' group CAIN - Central Atari Information Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

Are there any magazines still supporting the 8-bit Atari?
There are several:

Atari Explorer Atari Interface
[address] [address]

AtariUser Current Notes
[address] [address]

New Atari User 8:16
[address] [address]

Are there any product developers or vendors still supporting the 8-bit Atari?
B. Poehland has created quite a long list of firms devoted to the 8-bit Atari market. This file presently is located as atari.archive.umich.edu/atari/8bit/new/vendlst.txt.

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive

contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I write 8-bit Atari format disks on an IBM-PC?
Yes! See the file atario21.arc at the atari.archive. This program is for an MS-DOS type of computer. For disks written by atario21 to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes may additional feat ures. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, there is no ongoing product development by the manufacturer. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

310. Action! :(

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 18:37:30 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <89B5eB3w164w@cyberden.uucp>
Source record: 112869

Hmm.. Action! needs a runtime package to be transportable to non-Action!
8-bitters, yes? If so.. DAMN - SAM!!! Hmm.. I noticed on the archive
list (that Jeff was SOOO wonderful as to e-mail me.. I still got to
download it tho! I need more disk space!!! :)) that there were at least
two Action! runtime packages. I'd like to know which is the best, and
if one of you could send it to me somehow (e-mail/f-mail!?!?!... or disk
:)!!)
Mats Nordgren said that he'd send me his... but I haven't yet heard from
him, so I'm going to ask what else it's good for, what version it is,
etc.etc. I always imagined that Action! programs could be easily
compiled and uploaded for others to use. I guess I was mistaken?!
Thanks..
PhBill

311. Re: Explorer Proposal

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-25 19:25:58 UTC
From: reynolds@fsg.com
Message-ID: <1992Jan25.192558.4244@fsg.com>
Source record: 112857

I have several problems with the proposal from Atari Explorer.
First, this campaign for a new magazine was for an 8bit only magazine.
Any Atari Explorer connection wouldn't even be just ST/8bit magazine
it would be a ST/Lynx/Portfolio/LatestVapor/8bit magazine.

Second, in my opinion, Atari Explorer has always had the worst
reputation of the Atari magazines. The announcements tend toward
vaporware (anyone remember the 68881 board for the Mega ST, or the
ATW?) and the reviews are always positive. Atari Explorer is a
company organ and you can't expect it to be impartial.

Third, Atari has shown time and again that they won't leave
the editorial staff of Atari Explorer alone. I can think of at least
two times (possibly three) where Atari has stepped in and replaced the
entire editorial staff of Atari Explorer after a string of negative
articles. How long do you think the 8bit section would last with
articles reminding people that Atari has dropped support for us?

I recently acquired Activision's Pitfall II for $2. Not a bad game, especially considering it was written 8 years ago! Anyway, my question is how to reach the snake (rope?) A bat which moves very erratically is in the way; how do you get around it and the cliffs that come after it?

I also have an old Mountain King; could someone post a summary of the instructions, it didn't come with any. Pitfall came with instructions, but they didn't seem to help.

You should be able to use the linker and stuff from Ace C which is also
available at the atari.archive (acec.arc I think)...CC8 was basically a
replacement for the compiler in Ace C and eventually the guys who worked
on it released LightSpeed C which was sold commercialy for some time...

321. Re: Impressions of Explorer Magazine

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-26 05:10:52 UTC
From: esok@everest.ee.byu.edu
Message-ID: <1992Jan26.051258.1546@caedm.byu.edu>
Source record: 112867

I started reading the Atari Connection magazine back in 1983, after I got a year's free subscription (or maybe just a single issue?? It was a long time ago, back in fourth grade or so), but after two issues, Atari changed hands and the magazine got changed to Atari Explorer. I really liked the format of the old Atari Connection; they had user's programs, and profiles of people and their computers and what they used them for. They even had a "find the bug" contest where the first finder of the bug would get an APX game or something. And even the first few issues of Atari Explorer were neat--they had programming tips and stuff; I seem to remember a fairly in-depth tutorial on CIO and horizontal scrolling. But then they got into covering the ST more and more and the 8-bit less and less and I finally lost interest. Then I discovered Antic magazine (I had not previously known of its existence) and started subscribing to it. But near the end of its life (I think in 89) I switched over to ANALOG because they had more things I could use, but both magazines went belly up at the end of the year. Sigh.

I think in 1988, Atari Explorer sent me one final trial magazine, to get me to resubscribe to it, but it by then had no 8-bit stuff, all ST stuff, and nothing to interest me.

I only wish I had started subscribing to Analog earlier.

Message-ID: <1992Jan26.055002.2118@caedm.byu.edu>
Source record: 112868

To get past the bats in Pitfall II, you have to run underneath them when they are moving up. Be prepared to become frustrated. (But it is possible to get past all the nasties. I have cleard the first level.)

As for Mountain King: (What a great game! It was one of the first that I ever got for my Atari!)

Basically, you are trying to escape the dungeon with the crown. You may have noticed that there is a chamber at the bottom of the maze that is surrounded by fires and has a crown at the top. This is your goal.

Anyway, first you have to gather 1000 diamond points: each cluster of 3 diamonds is worth 10 points. After you get these points (one of the numbers at the bottom tells you how many points you need still) then the Flame Spirit\ will become available. (The number of the points you need will be replaced with a dancing flame and another number. This number represents how many points you will receive when you find the flame spirit.)
Anyway, once the flame spirit becomes available, wander around (usually near the bottom) until you hear music. Go where the music seems loudest, and use your flashlight to locate the flame spirit. (It is invisible, but will occasionally flash for an instant.) Once you have found the flame spirit, press down on the joystick (this constitutes kneeling.) A static field should be visible around your character. Now go to the bottom entrance of the crown chamber and kneel for a moment again, until the Skull appears. Now you can climb up the skull and go to get the crown. Climb up the sides. Now get directly underneath the crown, go up, and kneel again. You should hear a fanfare. Now exit through the bottom entrance, and music should start playing. You have either two or three repetitions through this song before your crown disappears to get to the very top of the highest mountain at the top of the maze. Go through the flame there, and then you'll be on the next level. Oh, by the way, avoid the bats while you have the crown on the first level, and on all higher levels, when you have either the flame spirit or the crown. The grey bats will take either away. You will also want to avoid the spider which resides on the very bottom level of the maze.\
I hope this helps. Let me know if you need more info.

Oscar, Z*MAGAZINE is released very week in the Atari 8 bit section of GEnie and can be dloaded from there. It is also here on the nets at archie in the USA. If I can find them from here in New Zealand (Some 12,000 miles from the Z*NET Headquaters there in New Jersey) I would suspect you can do the same there in the United States.

I agree with your comments re the content of Z*MAGAZINE it is the only true 8bit magazine/journal that caters for the Atari 8bit. I am sure should someone approach Ron Kovacs he would be more than happy to let you release Z*MAG in printed form. Maybe some of you should talk to John Nagy who is currently doing the Atari User magazine project, and ask him to do a batch for the 8 bit in its own cover. Atari User Magazine has about 2000 copies each month sent down here to the Pacific and we get them to read. So if you followed the same format under their guidance with only 8bit information I am sure you would have alot of success.

Food for thought..

> Did you what-is-his-name from Australia? That is like saying the USA is a
> state of Canada! Well it was me from NEW ZEALAND.

Hey, sorry, no offense or slight was intended! By the time I wrote the
article in which I said the above, I remembered only that a dozen or so
messages back, "somebody" from the Southern Hemisphere -- and I'd have
sworn the posting arrived here with a ".au" domain address, not ".nz" --
had commented on having never seen Atari Explorer magazine. Portal makes
it EXTREMELY difficult to cross-reference such things; if it were easier I woul
d certainly have
gioven you tpropoer credit. My apologies...

Incidentally, I recently saw or read a TV news story or newspaper article
which suggested that as the US and Canada build more and more economic and
social ties and crosslinks, "Canada could become part of the United States"
within the next few decades. So your simile, Jon, isn't all that far-fetched
and I refuse to be insulted by it. :-)

>Robert Puff, yes I
> remember him and the firm CSS. I remember his code and his attitude
> well more the point what he put in his code (what a smart ass assuming
> no one would read it.)

??? That's a comment I haven't heard before! What did Bob Puff put into
his code that shows an "attitude?" Speaking as a programmer who spends most
of his time among people who don't know, or care, diddly-squat about pro-
gramming, who will ask you questions then get snotty when they don't
understand the answers, I can say that it is very easy to slip into an
"attitude" when commenting/preparing-to-defend one's code... I say this,
of course, WITHOUT having ever seen the code/comments/attitude you attribute
to Bob Puff. I've "spoken" with Bob many times on his BBS, and even met
him in person (I didn't know who he was until AFTER I had already been
very impressed by his knowledge of the Atari), and he has never struck
me as having any "attitude" deserving anything but praise. Whatever you
are talking about, Jon, I'd be curious to see for myself. Bob IS extremely
BUSY, running CSS and the BBS and programming BobWare and (I believe) a
number of other, less-Atari-related pursuits... I would probably be a lot
crabbier and harder to deal with MYSELF if I had half as many things on

my agenda as Bob Puff does...

Sorry to waste bandwidth here, y'all, but I wanted to apologize to Jon (and support Bob, who isn't here to do battle in person) in the same forum where my original "what's-his-name from Australia" posting appeared.

And now, back to our regularly scheduled program.

Chris Chiesa
Chris_F_Chiesa@cup.portal.com

I'm against putting Atari Classics (AC) into the Explorer. IMO, the Explorer is just laid back and empty journalism. The reviews always give the thumbs up to every product; the information is often outdated or printed way too late; and, as you'd expect from a house organ, it gives the impression that all is rosy in the Atari world. And what the heck is the intended audience? ST articles, reviews of Lynx and 7800 games, stuff about the Portfolio, some 8-bit coverage--absolutely no consistency. Plus it is published a bit too sporadically for my tastes.

Everyone involved in this newsletter project should get a subscription to _The 2600 Connection_, a small newsletter dedicated solely to the ancient Atari 2600 VCS. It is slim (10 pages), but very well laid out, and--this is the important one--somehow manages to give the impression that there is vitality and excitement about the system. I don't know how they do it, but I look forward to that newsletter with the same anticipation I used to have for ANALOG. And they must be doing something right, as their subscription base is growing rapidly--they were given a significant plug in the magazine that started this discussion, Atari Explorer.

I think that something small, semi-professionally done, and with EXCELLENT AND INFORMATIVE ARTICLES AND WRITING would really take off for the 8-bits. AIM is okay, but I find that most of what they print is complete fluff, not to mention that it doesn't look much better than your average user group newsletter (which is what it is). I think someone with access to (and who's very adept with) a some quality desktop publishing software, a laser printer, decent scanner, and WHO CAN WRITE would be able to pull this off.

Believe me, if I had the above equipment, and more time than I currently do, then I would do it myself. And if the income from subscriptions and advertising covered more than printing costs, allowed me to pay contributors, and had enough left over for me to get by on (just dreaming here) then I would QUIT MY JOB AND WORK AT IT FULL TIME. Dedicated? Hell, yes. (And probably very stupid.)

Is this what you were looking for, Ben?

Dang, I'm sorry, I did it AGAIN -- included and sent a complete and unedited copy of someone else's article ... dang Portal interface... no way to retract it ...

Anyway, James Hague (exuhag@exu.ericsson.se) writes:

>Everyone involved in this newsletter project should get a subscription
>to _The 2600 Connection_, a small newsletter dedicated solely to the
>ancient Atari 2600 VCS. It is slim (10 pages), but very well laid
>out, and--this is the important one--somehow manages to give the
>impression that there is vitality and excitement about the system.

Okay, so how do we GET such a subscription?

>I think that something small, semi-professionally done, and with
>EXCELLENT AND INFORMATIVE ARTICLES AND WRITING would really take off
>for the 8-bits. [...]
>I think
>someone with access to (and who's very adept with) a some quality
>desktop publishing software, a laser printer, decent scanner, and WHO
>CAN WRITE would be able to pull this off.

I'd be willing to do some writing and/or typing, although I don't have access to the kind of equipment you talk about. I could at least put people's handwritten letters/articles into machine-readable form at a high speed, though! :-) I also flatter myself that I can write, though NOT that I necessarily HAVE ANYTHYING TO SAY! :-) Someone would have to feed me article ideas...

>Believe me, if I had the above equipment, and more time than I

I agree with that! There's no point in bashing Atari any more since we KNOW we can't expect anything from them! (Although we should have known that before, too...)

Have you ever read Computer Monthly? They have sections for practically all the orphaned computers, from TI99 to Osbornes, to Adams, etc. etc. etc. They're doing a bunch of great things wiht their machines. Why isn't there an Atari section? Can there be more Timex/Sinclair users out there than Atari 8bitters??

Regarding ZMAG: Lately it's been nothing more than tidbits on general computing, with notes on Apple and the Lynx dominating. Nothing particularly useful, but at least they're trying...

Well... I would subscribe to -Explorer if it had a decent amount of
8-bit support. But this is only if the price for Explorer is GOOD. It
seems pretty sane to mini-publish a magazine in the beginning, just to
get it around to all the other old 8-bitters who've upgraded to ST, and
might be willing to dust off the old boys for some more use.? How much
IS Explorer as it is, and would this publication addition add to it's
cost?

I have BOTH Xagon and Zybex. I am wonder, tho, does anyone have Dracon
or whatever that game is that was made by the same people as Zybex. I
heard it was much better. (I'll believe it when I see it!)
How would YOU like me to get Xagon and Zybex to you? I got both from
AtariBase BBS @ 408-745-219x (I use 2196 and 2194 the most). I THINK I
uploaded an ARC there of Xagon, Tapper, MazeWar, AtarTris I, LiveWire,
Tetrix, Xevious, and something else. Those are on my "Games Disk Side
#1". I BARELY use it! (too buzy telecomming/homeworking..!)
If you wish, I will soon be buying about >100< disks in bulk from B&C,
and could easily spare one or two, if you e-mail me your address. It
will take a while tho. These disks will be on my NEXT buying bing.
First I'm going after a bit of PD/Atari Logos! :)... What I'll do is
copy side 1 of my disk on one side, and my copy of Zybex on the other.
Sound good? Bill

Well.. you could try B&C Computer Visions (408)986-9960, San Jose
Computers, (408)995-5080, or BEST Electronics (#?) for the schematics.
From what I've seen of the supplies (I haven't seen BEST's), B&C is more
probable to have it that SJ, but you could try..

> If anyone knows of any, please mail me or:
>
> Internet:
> auepw@acvax.inre.asu.edu
>

Well.. Both San Jose Computers (408)995-5080, and B&C Computer Visions (408)749-1003 have SX212 modems.
I got mine from San Jose for $30 + $10 for SXExpress! (which I NEVER use now that I have BOBTerm, so if you can get a copy of BobTerm from someone (can you convince ME?)).
B&C sells it for $60, and (let me check for software..)...hmm, can't seem to find sxexpress! anywhere.. But, I'd go for SanJose anyways.
NOTE: the sx212 does NOT need any interface, it comes with BOTH the SIO cable (atari 8-bit), and the rs232. You'll probably have a little trouble getting the phone cord in the back if you don't have a nice and small Y-adapter. The one I bought was pushed out of the way by the SIO cable, so I got a F-F adapter, and the REALLY TEENEE phone cord that came with my phone for some odd reason, and hooked it up that way.. (sort of MESSY, tho.)
Also, the SX212 has only >1< sio cable, so you can't daisy chain AFTER it..

Well... the idea of a computerized magazine is sort of weird. I don't know. I guess if someone (like I will soon) has ComputerEyes, you could use that to add the pictures. If someone was smart enough to make a screen capturer, you could, say, pause a program, then capture the screen or something..?? (weird, eh?)
Animation might be nice.. and music.. Will keep readers' attention. I don't know.... I'm only on UseNet, so how could >I< get files!?
Thanks-
Bill

PS, what about cost? Are these people devoted enuff to make all this, and then just POST it?! Maybe a mailed disk and photocopies of screen pictures or something...

OH! Also, APACViewing might be a nice way to do 80x96x256 pictures!? Who knows... this seems to be so early in the works, that it'll depend on our feelings (probably AT the moment!) on which way it'll go...

Thanks
again

As to your Digi-studio.. It sounds AWESOME! (BTW: how easily will you be able to incorporate sound files into BASIC? I've been looking for something like that for a while!) (Also, BTW: can a Parrot I be hooked up to it? I am getting a used one, and he isn't sure he can find the software, not being where IT is...)

Ok... On ICNET (I think it's called), the Net that a bbs called West Coast Syndicate is netted into (it runs off Carina II, and some sort of XL/XE machine, with ... oh! 130 meg!!...oh!), a "friend" of mine named Shadow runs a company called Shadow Software. I have a file of a capture, or perhaps a printout?, of a list of companies, including his own, that support 8-bits (this is as of at the earliest, October 91). He also posted a message asking for people who are interested in making $$ from their software. From how he explained it, I'm deducing that you'll PROBABLY make A LOT of $$ off of this! (that reminds me, I have to write him about Atari Classics magazine...)
So... I'll be one of the 1st to buy it! (I hope!)
Maybe you can use this net to find out what upgrades/bugs need to be added/fixed in any later releases?!
Bill Kendrick

Hmm.. that's true. That's probably why half the 8-bit community has
either given away, sold, trashed, or "closeted" their 8-bits. They don't
know about US.. the OTHER users. I say publish a DISK based magazine.
With this, you can **oh!** SAVE PAPER! It can be called the
"environmental 8-bit magazine!" hehe... But, seriously:
I think that just mailing a disk to people, rather than a whobook of
info. is bette and also, the on-line mag idea isn't good, as the previos
message says.

Hmm....let me do a run through on all the modes I ever use (all the BASIC modes, I never bother with the extra two or three ANTIC modes)

0 text 40x24, 2 colors, artifacted (green or blue and red sometimes)
1 text 20x24, 5 colors, fairly useful.. only get 64/256 characters avaliable, tho.. but it's ok
2 text 20x12, same as above, but bigger vertically
3 grfx 40x24, verry blocky, only 4 colors
4 grfx 80x48, sorta blocky... could do the same using a text mode and the 1/4, 1/2, 3/4 characters, plus another 2-block diagonal to make it perfect.. only 2 colors
5 grfx 80x48, same as above, but 4 colors
6 grfx 160x96, same as 4, but 4 times the resolution
7 grfx 160x96, same as above, but 4 colors
8 grfx 320x192, this is the hi-res mode, it is artifacted- that is, if you put a vertical line at location 10, it will be, say, blue
if you put a vertical line at 11, it will be red
if you put one at 10 >and< 11, it will be white
if you put one at 11 and 12, or 9 and 10, etc, it will be white, but a little different. This is very much like the text mode 0, but pixelized.
9 grfx 80x192, don't let the res. fool you.. this is VERY good for digitized pictures. It is a 16-shade grey mode. You can select only background colors here, and the COLORs will be shades of it (if the background color is not a multiple of 16 (POKEd), or has a third parameter (luminence) in the SETCOLOR x,x,x command, the colors below the luminence will not be seen, so if it is 14 or 15 (both the same to SETCOLOR and POKEs), only color 15 will be visible (it's brighter than the brightest in all the other modes)
10 grfx 80x192, again, this is a 16-color mode, but you can change

the colors around, (unlike 9, above, and 11, below). The
background is changed with POKE 704,x.. all the other colors
(1-8, 0 being backgd), are set with 708-712.
11 grfx 80x192, this is like a switcharound of mode 9. Instead of
having shades of 1 color, you have colors of 1 shade. Set the
background (712, or SETCOLOR 4,..) to a luminence, and then all
the colors (except black) will be that luminence. It's good if
you want all the colors fairly easily. I made some pic's and
then used a multiple DLI to make the top dark, the middle medium,
and the bottom bright.. looked interesting)
12 text 40x24, this is the IRG mode. It works like mode 1 and 2,
but in a multicolored (4 pixels-byte, each two-bit setting a
color), because you PRINT #6, unless you change the display list
of mode 0 to ANTIC 4, not ANTIC 2. An easy way to display
a fake 320 mode (making it look like mode 0), is to shift all
the characters over 1 bit, and then changing the 2-bit together
color to "bright", and the "01" and "10" (1-bit) colors to
medium, and the background to dark. (get TRICK320.DMO from
AtariBASE (408)745-2196 to see!:))
13 text 40x12, this is like a switcharound of mode 1, because the
characters are higher than they are wide. The mode is also
multicolored, like 12. If you've seen the game BROS (a super
mario clone), it is in modes 12 and 13 (changes with the select
button). It is good for making a "multicolored mode 2", (12 is
good for a multi-c mode 1), because you have 128 of the charactrs
avaliable. In modes 1 and 2, you have 64 in 5 colors.
In both 12 and 13, the inverse characters change the 2-bit color
(seen as 710, or SETCOLOR 2,) to the "extra" color avaliable only
in modes 1,2,10, and 12 and 13 (and also sprite mixing, such as
fifth player out of missles). If you want inverse, you could
...I won't explain.. get TRICK320.DMO.. It'll show it... It's
good for a spreadsheet or something.. (then again, so's a
sprite!)
14 grfx 160x192, this is also called 6+ or 6 and 1/2, I guess (because
the next mode is 7+ or 7 1/2). It is only 2 color.
15 grfx 160x192, this is the 4 color mode of 14. It is to mode 12 as
mode 8 is to mode 0. It is used quite often, mainly in drawing
programs.

Any addition of 16 to a mode call (GRAPHICS, OPEN, some sort of ML OS
call?) will turn off the text window (except in modes 0, 9, 10, and 11,
because they have none... you can add them (neat in mode 0), by POKEing
703,4.. You can't see it in 9,10, and 11, and it will have a fun effect
in mode 0. Modes 9,10,11 are also "turned" on by going POKE 623,64 192
or 128. (or adding that to the current value.. turning those last two
bits on. This is in case you have a funny sprite priority mode on and
don't want to screw it up.) You could use a DLI to change this PRIORity
setting on a text window and have it in mode 8 or 15 or something. Note
that the GTIA modes (9,10,11) won't work correctly if their forced on in
this fashion on any mode but 8 and 15. (except 10, because it is a 9

color, not 16 color mode).

Was this long enough!? Did I get my info. across?! I hope you don't
have any manuals that already explain this, because I would've wasted the
time typing!

348. Atari Expo 1991 Demo

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-27 02:55:03 UTC
From: omf@jab.tucson.az.us
Message-ID: <gyT7eB1w164w@jab.tucson.az.us>
Source record: 112880

My apologies to those of you who happened to get my last message describing the upload which follows. I had to make some changes to accomodate the mail program on the BBS I use ...

Anyway, do to popular demand, I'm uploading the demo disk for the 1991 Expo in UUENCODEd format. I'm surprised that more people don't know about it since it's readily available on GEnie. Anyway, it's over 100K broken-up into 9 posts. This will probably annoy those receiving Info-Atari8... please forgive me!

The file was downloaded from GEnie and was originally in DCM format. I uuencoded this into 14K file chunks to accomodate the fact that my mail program only accepts posts of less than 255 lines. You'll have to put the next 9 posts together and UUDECODE it. The file you get should then be un-DCMed using Discommunicator 3 (Bob Puff's).

It's definitely worth the trouble! At the very end, you'll have to wait through a rather long scrolling message from one of the authors of the demo, at the end of which you can press START to listen to some pretty impressive music. (Don't wait through the first scrolling message, which is in DUTCH - the last one is in English).

Here's the file. Whomever has FTP access to atari.archive, please post the DCM file there (I don't have such access).

Message-ID: <92026.215547JJMCWILL@MTUS5.BITNET>
Source record: 112881

Okay, I was digging through my Stuff Box, finding lots of neat stuff I don't currently use, like an MPP Microprint, P: Connection, 6 System Box for having up to 6 OS ROMS in the 800XL, etc. etc.... and I found what looks like an Rverter, but from what I remember, it never worked properly. I would plug it in , and any I/O to say the floppy would cause the Status LED's on my Supra Modem 2400 to flash on and off strangely.
It has an SIO male cable going into sort of a CART sized box. On the box is a Female SIO connector.
Coming out of the BOX is another cable with a DB25 on it. When you pull the PCB out of the box, it says "Supra Corporation" on it.
Underneath that is "30-0013-1". The components on the board are a 74ls126, another 16 pin IC with "uA1489PC" on it, a cap., and three resistors. Is this an Rverter? I checked all connections and they seem okay, and none of the traces look bad either. I paid like $20.00 at a WOA show way back about three years ago. Never used it because it never worked properly, but I sure would like to have it as a back-up RS232 interface, if indeed that is what it is.
Can someone out there help me out on this one? I would greatly appreciate it.

Well, I also found my Galaxians, Millipede, and Airball carts...
I hate Airball, but Galaxians and Millipede are my favorites!...
What are other people's favorite games?

I have The Pawn, but never figured that one out either....

Source record: 112882

I apologize to this newsgroup for posting an item that has nothing to do with computers. I would hope, however, that after you have seen this post you will agree there a few things that transcend computers.

For the past several years, I take January 28 as a personal holiday.
On that day, I do not answer the phone.
Nor do I answer mail.
I take that day for myself.
And I remember.

In Memoriam:
January 28, 1986

She wished to teach her class from Space, and thus to consummate
The Grand Idea: that even Wives and Mothers now could state
The stars above at last were ours, for Everyone, and not
Just for astronauts, courageous men who cast their lot
With danger. Not aware was she of what a heavy Price
Can be attached to Knowledge; no conception loaded Dice
Were to be rolled upon the other six with her that day,
Upon the great experiment whose fate was now in play.

Did they have their private doubts, or fears, these seven crew
Soon to join the company of those selected few
Of humankind who satisfied with precious, fragile lives
The dreadful debit that accrues whenever mankind strives
Like Icarus did, to cast away and flee the primal chain
That straps the mind of man to earth with ignorance and pain?

Beneath the ozone gaming board were men who clearly saw
Destruction wrought from blow-by gas upon the field-joint flaw,
And raised within the Labyrinth a tocsin of alarm
Foretelling of disaster, violence and harm.
But high above the lattice-work a Schedule had been set:
By magic of their Signatures, each Player placed his Bet
To quell the voices of concern, and show posterity
What happens when the light of Truth gets cloaked with Fantasy.

There were questions of the ice, of course, but no one dared
Disrupt the sacred List Of Yearly Launches. Were they scared
Of losing face, perhaps? Well, damn the ice! Full speed ahead!
A pox upon you sayers of disaster, gloom and dread!
A Go For Launch! Ignite! Amidst the thunder, flame and smoke
Did no one spot the darkling puff, the booster seal that broke?
What would the Throwers Of The Dice have done, were they to know
Their folly would be captured live, in color video?

The children don their party hats to watch the big bird fly,
And cheer to see that mighty ship, now racing through the sky
Enveloped in a blazing cloud of orange and grey and white,
Diffusing to a milky fork. A most peculiar sight,
As if the broadcast channel had been commandeered and changed
By some fantastic artist all demented, or deranged.
There comes a moment's puzzled pause: "What happened to the show?"
Small voices ask, in plaintive tones, "Where did the Shuttle go?"

The men of Houston stare in shock at data screens, aghast;
The nightmare long predicted, seems happening at last.
They pray within their heart of hearts (as always, not aloud):
Challenger, so beautiful! Exit from that cloud!
Fly away from all the steam, the flaming hot debris--
Let us see you sailing on, magnificent and free!
What's taking you so awful long? Why do you not appear?
Telemetry is lost! Come in! We can no longer hear!

Upon the Flight Deck miles above, perhaps a final shout.
Who possibly will ever know? The cabin lights are out.

In helpless horror unified, silent and alone,
Do millions watch in speechless awe as Nature claims her own.
Unerringly, without remorse, must Newton's Law behave:
Gleaming ship and gallant crew descend into their grave
Beneath the fluid bosom of the timeless rolling Sea
That spawned this race of seeking men, these astronauts to be.

The Rogers Team did yeoman work upon the sad event,
Discovering in course of time, 'twas not an accident
But rather caused by human ills the ancient Greeks knew well:
Duplicity and hubris are a ransome paid in Hell.
The Ransome paid, the Game is closed, the Dice are locked away.
(But what rough Beast, with cloven claw, is picking locks today?)

A Shadow plagues the silent Pad. Old enemies devise
Cruel arguments to make us doubt our Mission in the skies,
To fan the winds of discontent, and so to make it seem
That every man is rogue, or fool, who ever chased a dream.
But buried deep within the marrow, core of flesh and bone
There burns a Flame as old as Man: to Know the Great Unknown.
We cannot pass that sacred Torch to those who say we must
Allow the dreams of seven souls to perish in the dust!

Those seven faces haunt me still: so vibrant, so alive!
Embodiment of noble aims whose Spirit does contrive
Heroic thoughts that stir my pulse; ideals, the Very Best
Of what Mankind delivers when committed to the Quest.
I feel that Spirit in the stars: exuberant and keen
With Vision set to persevere, explore the wondrous Scene
We've barely glimpsed. We seek our Destiny in powered flight,
Perchance to find- beyond the stars- the Source of distant Light:
Sensorium of Great Events where Being is Begun,

Where Human Grasp and Boundless Dream are melded into One.

But now, as I reflect upon that tragic day each year,
My heart again must ache. In vain, my eyes suppress a tear.

- Benjamin L. Poehland

Z*Net isn't posted on the internet because it's so big, I assume.

That's one reason. Another is that it's got its own mailing list which you can subscribe to separately.

This issue has comes up about every 6 months or so; somebody suggests that it would be a good thing to post ZMAGs, or somebody just goes ahead and does it, and the Info-Atari8 subscribers get inundated. Some subscribers aren't interested in ZMAGs, and have even felt compelled to unsubscribe, rather than be forced to wade through a bunch of stuff they're not interested in. Since there's already a separate list you can subscribe to, those who are interested in receiving ZMAGs can get them without inconveniencing those who aren't.

I believe that another reason the volume matters so much is that some folks read the digests by downloading them to their 8-bitters and looking at them at their leisure. For those folks, disk space becomes a real issue, and a pile of unwanted ZMAGs, a real hardship.

To subscribe to the ZMAG distribution, send mail to

zmagazine-request@virginia.edu

(I think I've got that right) and thanks for helping keep the Info-Atari8 list useful to all its subscribers.

352. Re: 8bit Atari forth?

Cross-posted to: comp.sys.atari.8bit,comp.lang.forth

A friend of mine wrote a version of Forth for the Atari called ATILA
(A Thread Interpreted Language for the Atari) about 6-7 years ago.
He had sent it to A.N.A.L.O.G. magazine, but they refused it saying
it was too large a project for their magazine. He really didnt do too
much with it after that.
It is a real nice package, I think he even wrote a full screen editor
to work with it. It follows standard FORTH-86 (? not sure of this)
conventions. If there is interest, I will try to contact him to see
if he will release it to PD or at least give me permission to upload
it to the archive, or post it here. He has moved away, so it may take
some time to get in contact with him.
If anyone is interested, drop me e-mail at deej@grouse.umesve.maine.edu

Dear Fellow Atarian NETters,

I would like to know if _ALL_ of the information on the a8 digest
is in the public domain... reason being that my user group,
OHAUG, would like to reprint some info in it.
And, Who do i get in touch with to list OHAUG onto that great big list
of User Groups that came out several issues ago?

And now, for my own 2 (maybe 3) cents of comments and questions:
Although a NETwork magazine is a nifty idea, I agree with
those of you who say that it should be a LAST resort. The only way I found
ANTIC magazine (when it was still in print) was at a newstand. I had never
heard of an _all_ atari magazine (besides the LONG defunct Atari Connection),
and only after someone MENTIONED the title in COMPUTE! did i start my search
for ANTIC. To reach the most people, you've gotta be out in the newstand.
As Mr. Poehland said, not ONE person in our UG (other than myself and
Ben) are aware of the existance of the INTERnet or ANY "net". A NET magazine
would be out of their reach, period.

Someone made mention to hooking up a laser printer to an atari 8bit...
well, count me as interested too. Ive got a HP Deskjet 500 that I'd like
to hook up to my atari, but I'm a bit hesitant to just plug in my
interface (XETEC grapphics interface) into its port... and then even
if it partially worked, it would probably be a nightmare to figure out any
useful codes, no? I wonder if it would be reletively easy to make a driver
for it, not only to print character graphics, but to print color too.
Perhaps from some paint program like RAMbrant etc...
(No printer ribbon swapping here, its an inkjet.)

Has anyone ever heard of a program called CALCULUS DEMON? In an OLD
catalogue/book, this program (supposedly?) did symbolic integration and
differentiation. I doubt it's anything like MACSYMA, MATHEMATICA,
or DERIVE, but I once attempted a simple integration program and
fell flat on my programming face!

What ever happened to (I think the name was) Bill Wilkinson? He
used to write the "INSIGHT: Atari" column of COMPUTE!. I always looked
forward to reading his column!

Regarding the message from the editor of the ATARI EXPLORER, the
editor's point is well taken : publishing an entirely separate magazine is more
difficult than just inserting a special 8bit section. When ANTIC was on its
"death bed", it seemed that not only did advertising continually dwindle, but
so did the quality and quantity of programs/articles. I support the initiative
to create a new, stricly 8bit "Classic" magazine, but I have a few doubts:
Could it be that a monthly magazine presents too much of a challange to

fill with useful material (in re: quantity/quality of a dying ANTIC)?
Do you NETters beleive that the Atari 8bit has reached or CAN
reach a point when All that there is to say about it has been said? When All
that can be programmed has been programmed? Sometimes I find myself saying
yes, only to be amazed at a new program someone comes out with.
What do you think?

I sincerely apologize for the length of my submission- rookies are a bit too
wordy; and I look forward to your responses and opinions.

Source record: 112898

Does anyone know how many mAmps the +5v line and the 4 ttl lines
of the 800 joystick port will supply?
I want to drive 4 relays, each from one of the ttl lines of the
joystick port, and I'm wondering if I can drive them directly, or if
I have to use a separate power supply, and run them through a transistor using the ttl line
to enable.
The relays I am using require 72ma nominal at 5v to activate.
thanks....

While there is no ongoing developement by IVD for SpartaDOS, there are litterally 100's of user written utilities that exist, and many more in the developement stage. Any of these modules can be used with the SpartaDOS X cart or disk based SpartaDOS. There is even a file that will give disk based SpartaDOS the SAME capabilities as the X cart.

Source record: 112802

I need some help from the technical folks out there. My
psuedo-programming/computer graphics course professor has told us
to go out there and write a program (in C) to draw a line. Thinking
it would be easy, I modified the Gr.7 drawing program in the
"Inside Atari Basic" book to draw in Gr.3 and I was going to try
to see the patterns created (so I could maybe create an algorythm to
draw a line between ANY two points). The problem became very
apparent very soon: I know there is a pattern, but I CANT FIGURE IT OUT!
So, how DOES to DRAWTO command figure out to draw a line from any two
arbitrary points? (I mean BETWEEN any two points). Thanks ahead 'o time.

Chris,
Well I guess I should offer the same (apology week here chaps), I did
jump in the deep end a little.

As a small point Portal is one of the famous systems, well to me anyway.

Of late this section has brought back some very fond memories of the 8 bit
and some of the anitics we used to get up to a few years ago.

Ian (if you are reading this) do you remember the comments in Rob's firmware
and software, one assumes he assumed from the comments you would never get
this far to read it and if you did you were to ....

(ah well you get that in the small cities...)

I thought I'd check the net to see if there's interest
in a small hardware modification using the parallel bus
to backup carts to disk and run them without further
hacking. I haven't finished the mod yet, but it looks
fairly simple (one IC + a switch).

Has this already been done? My intent is not for piracy,
just for backup & execution from disk. Is this something
that you'd like to see in the archive?

Any comments or suggestions would be appreciated.

Message-ID: <9201272217.AA07668@xap.xyplex.com>
Source record: 112781

There are computers that are newer than the Atari 8-bit, but for beginners I can't think of any that are better. There are plenty of high-quality games for it, so it's quite an acceptable game machine. If you expect to pique their interest in progamming, it is ideal. You can do more interesting things with graphics and sound more easily with 8-bit Atari BASIC than with any other computer I've ever seen. It gives you enough to pull your interest as deep as you want it to go, and the 8-bits internal environment can take that a LOOOONG ways into the workings of real-time systems. Sure, other systems may offer more power or more sophistication, but that comes at a significant price in complexity. For example, a Macintosh is a wonderful power tool, but if I want to hack out a program with a bit of color and sound embellishment, give me an Atari 8 bit.

Floppies are a bit delicate, but some younger children can be taught how to handle them. Backups would be VERY important while they learn. Young children respond reasonably well, to clear, simple rules that make sense at their level. They don't need to understand why very much, just what, like ALWAYS hold the disk here, NEVER touch it there, NEVER take it out while the light is on or the box is whirring, and such. Examples they understand are good. Touching the disk there is sort of like touching your eye. It is a sensitive place, not intended for fingers. Some kids handle stuff like this fine. Others are chronically thoughtless and hamhanded and don't learn. They tend to grow up to be similar adults. The biggest thing is to PLAN for mistakes, and involve the kids in fixing them, so they learn consequences.

Source record: 112902

Hiya, Ben!

I'm not a real vocal guy here on Usenet, but I'll put my two cents in.
Mr. Jainschigg's offer seems quite generous. It is probably the last
place prospective authors of 8-bit programs and articles can actually
get paid for their trouble. I don't know how others may stand on
his proposal. I remember reading your vow to only work in 8-bit
exclusive magazines in the future; I wouldn't want you to compromise
your principles. As for me, I would probably subscribe to either a
separate 8-bit mag, or to Atari Explorer if they added an 8-bit
section. But I'll admit that Explorer has an edge: it is already
available on magazine racks in book stores wherever I go, giving an
8-bit section vastly more exposure to the public. This is the kind
of exposure we all lost when Antic and ANALOG went under. I would
also support an 8-bit section in AIM (to which I already subscribe).

From: mrsmart@cs1.bradley.edu
Message-ID: <mrsmart.696557693@cs1.bradley.edu>
Source record: 112903

after recently picking up my interest in Atari 8bits again, I have acquired some new equipment. The disk drive I got I am not sure if it is an XF551 or not (I was away for a long time). It is shorter than my 1050, and grey, with these kind of vent things on it.

My other question involved the XM301 modem. I could not get it to work with the 1200XL. DOes it drow the power from the SIO port. I remember someone saying something about there being no +5V from the 1200XL, but there was a way to short out a resistor to make it work. (the modem works fine with my 800XL and 800.

I also recently recieved some disks and a little box which was attached to a DB9 connector with an IC inside. It this some sort of Copy Key?

Also any information you can give me about the XF551 if that is what I have would be great.

LONG LIVE THE 8BITS!!

Message-ID: <Jan.27.19.37.26.1992.29770@remus.rutgers.edu>
Source record: 112904

Just to throw in my 2 cents worth. While I appreciate the offer/
proposal made by Explorer, I really don't see it being a good
idea. If that's the way it goes, I WILL subscribe to it, but
I prefer the original idea of a seperate 8-bit magazine entirely,
most likely put out by the folks at AIM (I personally think they'd
do a good job with it). Failing that, I think James Hogue made
a good comment about "The 2600 Connection" - I recently found out
about it and sent for a sample copy. After I received the sample
I immediately subscribed for a year...and I haven't even touched
my 2600 in almost a year! Why did I subscribe? Because they do such
a great job with that newsletter...it's done by people who really
love the system, and so they captured my interest and made me want
to see more (maybe I can find out some more "easter eggs" that I
hadn't known about, or read some interesting trivia). So I wouldn't
mind seeing an "Atari 8-bit Connection" newsletter come about if
the magazine idea falls through.

What res!? I've READ that the 7800 can be 320x???, but is that like in
text mode pixels, and gr.8 pixels?

Where can I get a 7800?

Geeze! 2600 programmer! Don't put me down! (hehe!) I guess I have the ablitiy to program >OUTLAW<! hehehe!!! Actually, for the past 9 years, I've programmed in BASIC on my Atari, I got a disk drive in 1986, I think... (I had the tape for about 2 years before that, and before... PAPER and PENCIL!! No wonder I'm lazy now! :)).. I just got my modem back in late late Sept.91, and I just got into UseNet about 2 or 3 months ago. So... that means that I didn't have TurboBASIC or MyDOS until a while ago. I had never HEARD of SpartaDos, B&C ComputerVisions, San Jose Computers.. I totally forgot that BEST ever exsisted! (they used to be at the mall near here...) So, I'm just a youngster in this little 8-bit world! Also, I JUST got my Mapping last Friday, and I got DeRe back in Sept/Oct along with the modem!
Too many dreams... lots of experience.... NO PATIENCE!!!!!!

Interesting..._The_2600_Connection_? I know that the 7800 is still
(barely) alive, and the 2600 "re" came out once (back a couple of years
ago.. even as a TEENEE TINEE one that was in a box about the size of a
joystick box!), but I never realized that that many people still actually
USE them except a few of us 8-bitters, myself, and my exgirlfriend (not
enuf $ for a Nintendo...also, NES's are peices of CRAP!, if you'll pardon
my French...)
I hope that T2600C doesn't GIVE AWAY EVERYTHING, HENCE REDUCING THE VALUE
OF THE GAMES PURCHASED FROM say $20-$40 down to >$0<! LiKE NINTENDO
PUKER!! I mean Power!

Also, I subscribed to Game Players magazine, and by the second issue I
received, they said that they were breaking it up to PC, NES, Sega, or
something like that.. I said "end my subscribtion" (BTW: this was BEFORE
I ever got the magazine, not after two issues.. I was mistaken, the two
issues were the ones I received so far).. And just today, I received th
e NES dedicated issue! I WANT MY MONEY BACK! NOT SOME DUMB MAGAZINE FOR
SOME STUPID USELESS, OUTDATED-THE-DAY-IT-CAME OUT NES and GAYmBOY!!!
God! TALK ABOUT PRESSURE!!!!! Sorry, but I'm a little P/O'd today...:(

BECAUSE I'VE FALLEN! AND I >CAN'T< GET UP!!!!

Actually, I'm wondering if there's any "Prodigy" like graphics terminal program or something? (I'm sort of confused about how to say this).

Hmm.. say I called a BBS, and for the title screen it drew something on a GRAPHICS 7 screen or something. That'd be interesting. Is there any program like that, or would it be worth one of you people's time to make? I could see it sending GRAPHICS on/off commands, COLOR commands, PAINT, CIRCLE, DRAWTO, PLOT, etc. The GRAPHICS 7 mode will have the normal text window (I picked mode 7 because of the only 3k it takes.) Perhaps it could use a TEXT command (I'm supposing someone pulled in a couple of these TurboBASIC XL commands... PAINT, CIRCLE, etc.) (call me Mr.BASIC! ;))

But does this sound any good? From what I've seen on commercials, Prodigy looks pretty spiffy. Hey! Even have the Term program send X-Y coordinates from a Koala/Mouse/Light Pen/Joystick or something. Make it like using icons/etc THRU a phoneline onto another computer! It'll be the END of keyboards!

Ok... call me a dreamer!

THEY THINK I'M CRAZY! I'M NOT

Source record: 112809

Yes, you have an XF551, one of the best drives, IMHO, for the atari.
It is a 360K Double Sided, Double Density disk drive. In order to take
full advantage of this drive, you need either MyDOS or SpartaDOS.
You can also upgrade this disk drive to a 720K 3.5" floppy if you wish
to at a later time.

To get your 1200XL and XM301 modem working together properly, do the following:

Turn your computer on its back. remove the six phillips head screws which hold
the case together and place them in your parts dish. Turn the computer right
side up and lift the top cover up and towards the front. Look inside and find
the two ribbon cables which connect the keyboard and console LEDs to the main
computer board. Carefully unplug these cables noting the correct polarity
of their connectors. Remove the keyboard assembly and set it aside for now.

Remove the six phillips head screws holding the computer board in the bottom
case. One of these screws is in the upper left hand corner near the on/off
switch. Another is in the upper right corner and goes through the heat sink.
The remaining four screws are across the front and about four inches apart.
(Three of these also hold down the metal shield.)

Remove the computer board assembly from the case. Lift the front of the
computer board and the cartridge/joystick/switch assembly up and pull the
computer board out and towards you until all the rear connectors are free.
Remove this assembly, separate the plastic piece from the PCB and set it aside.

Remove the metal shields and set them aside. There should be several 'push'
rivets. Remove these then separate and remove the metal covers. NOTE:
Some metal covers may be held together with bent metal tabs or screws.

Replace resistor R63 with a jumper wire... It is just to the right of
transistor Q3. Remove this resistor and replace it with a jumper wire.
(Any piece of 24-30 gauge wire will do)

Reassemble and test. Now you can use the XM301, P:R: Connection, etc.
with your 1200XL.

I copies this info. almost verbatim from the ICD P:R: Connection manual.
I did the mod on my 1200XL and it works fine.

> that I don't want to get anything that isn't 100% 850 compatible.

The question here is that a PR isnt 100% the same as an 850.
It says so in the manual for the Product.
However for using a 2400 baud modem it works flawlessly on the
most popular versions of software. Its actually better in my opinion.
I have most of my outlets used and if i used a 850 over a PR, id have to
plug it in! (ugh!). The 850 works on a 1200xl without a mod. The pr doesnt.
The handler programs that auto load might not be the same.. Ive never
investigated.

The DeskJet, and HP Laserjets can be hooked-up as easily as any other parallel printer (the dot-matrix most of us have, for example). Sending text to it will just give you very nice looking text. You only have to start worrying about compatibility when you start wanting to use the printer's special features (bold text, graphics, etc.). At this point, you're on your own, since there are no Atari 8bit programs that have built-in controll-code support for HP-PCL (HP's Printer Control Language). Well, I don't know of any program's that support HP printers, please correct me if I'm wrong. At any rate, making a printer driver or a screen dump program which can use an HP printer would not be much more difficult than writing such a program for any other printer.

The reason this whole thing came up was that SIO2PC, which is a program that runs on your PC and let's your 8bit use it to store files or to use a printer hooked up to the PC.

The game Draconus is one of the best releases *ever* on the 8-bit!
It from the U.K. software house Zeppelin Games, who produced other
great titles such ace Speed Ace, Zybex, Blinky's Scary School and
others.
What gets me about this posting is that these (quite recent) games are
copyrighted, and surely shouldn't be down-loadable from a BBS?! Unless,
of course, you had the company's permission. With Zeppelin being the most
prominant 8-bit Atari games producing software house in the UK, myself
being a prospective author, and with only 3 or 4 other companies still
producing new titles, this kind of attitude will soon put a stop to their
support.

Message-ID: <1992Jan28.131915.12434@aber.ac.uk>
Source record: 112816

Yes, Parrot samples work with Digi-Studio. They just have to be sampled at 16KHz to work best. I am currently writing some extra software to allow tune files to be used in Basic programs, as well as a sound editor to allow you to reverse pages of samples and copy pages of sample around in memory to create weird sounds! This will be released in a couple of months.

I think I have found a US distributor now (Chris Chiesa), who will hopefully agree to my terms of distribution (when I actually manage to mail him!). If you really want a copy now, then I am willing to send copies direct from the UK at 12pounds sterling inc. shipping. Payment by International Money Order only. My address at university is:

DEAN GARRAGHTY
23 YSTWYTH CLOSE
PENPARCAU
ABERYSTWYTH
SY23 3RU
WALES, UK.

You can also obtain copies of my on-disk newsletter from me at 2pounds an issue, as long as you order them with Digi-Studio (to take account of the shipping costs envolved).

Dean Garraghty. djg0@uk.ac.aber

381. Action! Runtime Compiler...

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-28 15:37:11 UTC
From: arlingto@remus.rutgers.edu
Message-ID: <Jan.28.10.37.11.1992.1857@remus.rutgers.edu>
Source record: 112819

I have seen a couple message asking about how easy it is to get Action! programs to run as stand alone object files that do not need the Action! cartridge to run. It is very easy to do! You can make any Action! program into a binary file that any Atari 8-bit owner can run.

There is a easily obtainable and very nice Public Domain Runtime Compiler for Action! out there. I have used it on all my programs. I think the program of mine that most got into the PD that I wrote in Action! was my PREPX SpartaDos X disk preparer utility that anyone can use. I also had a program published in ANALOG as a binary file that was written in Action! and compiled with the PD Runtime Compiler.

The PD RT Compiler is very easy to use and well documented. It even produces a listing of all cartridge routines that are called by your program so you can leave all the others out of the runtime library. This is a very nice feature that allows you to produce pretty small object files if you stay pretty much out of the cart routines. Anyone who has coded a bit in C can figure out ways to get around a lot of the more chrome-type cart routines.

The only caveat I found in using the PD Runtime Compiler was that you have to include a small piece of inline assembly code at the very end of your program for the runtime compiled version to exit cleanly into DOS. (Without this small assembly piece, the runtime compiled versions hang at completion.)

So, don't let the idea that nobody will be able to use your programs stop you from programming in the best Atari language!

Dave

382. sio2pc

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-28 15:57:36 UTC
From: soj@iesd.auc.dk
Message-ID: <1992Jan28.155736.482@iesd.auc.dk>
Source record: 112820

Well, I have been writing a program similar to sio2pc in C++ (object oriented C) and it does about the same as sio2pc, only it does not use diskimages, but accesses the harddisk of the pc directly. It scans a directory and creates map/directory sectors corresponding to the contents of the pc-harddisk. I found the idea of diskimages i little "unhandy" as you have to copy files in and out all the time.

The program lets you read/write excisting files on the harddisk, but I hope to have it working as a full diskdrive with creation of new files on the harddisk soon. The scanning of subdirectories will also be added when I have some more time to waste.

I have no techincal information on the Atari so I have used the trial and error method to make the timing/frame sequences work. When the program some day seems to work perfect, I will tell you other hackers on the newsgroup.

Does anybody know how to hook up the Atari (composite) to an IBM EGA (RGB) monitor????? I guess it involves some sort of converter??!

Most of the op codes perform two instructions. For example, to clear a 255
byte section of memory the original code in ML may have been something
like:

```
LDA #0
LDC #0 ;or TAX
LOOP
STA $8000,X
INX
BNE LOOP
etc
```

Whoops! That was LDX not LDC. Anyway, once the thing was running some authors
would go back and maybe replace the LDA #0 with the LAX and the next few
bytes with the illegal NOPs i.e. $OC or $DC. Then when someone tried to
disassemble from disk they'd get garbage. I believe it mainly happened
with the Commies & Apples. Of course if the 6502 manufacturer cleaned
up the design or came out with a new processor like the 65C02 they may
use some of the numbers for new instructions. The 65C02 uses $0C for
TSB Test and Set bits with the Accumulator. If you ever really want to
look for the codes or at them, just deposit the bytes in memory followed
by a BRK & jump to them. Most monitors will display the registers assumming
your computer isn't off in La La Land <g>.

All the joystick lines are brought out/in through 880 Ohm resistors so you can only get about .3 mamps out of them. You can draw 200 mamps from the 5v line on the joystick so you don't need a seperate power supple. The defacto way to drive a relay is with a PNP transistor since it will be off when the computer is off, off when the computer is off. It can only be turned on with software. A 3906 from Radio Shack (Trash) should work.

```
joystick 5v-----------

Does anyone have the specifications or the instructions for
modifying the 1050 disk drive? I noticed that some programs cannot use
an "unmodified" 1050. What does this mean? Also, I would be interested
in any information about specific companies that supply memory upgrades
for the 800XL, and how to install those memory upgrades.

Okay, as per my previous forward message from Greg Lindahl, the Z*Mag
mailing list that jrd mentioned is not available at this time.

BUT

I just checked atari.archive, it seems somebody's been busy:
We have a new directory, /atari/8bit/zmag, which has MANY recent issues,
and according to what Jon Clarke just said here, this new source should
become a new, reliable, up-to-date method of obtaining Z*Mag through
the Internet.

Thank you, whoever you are!!!

In a message whose header Portal doesn't pick up for me to edit into this followup (and which the author didn't SIGN -- please, people, all hosts are NOT created equal; SIGN your net address even if "it's already there"), someone with the initials TG writes:

>I thought I'd check the net to see if there's interest
>in a small hardware modification using the parallel bus
>to backup carts to disk and run them without further
>hacking. I haven't finished the mod yet, but it looks
>fairly simple (one IC + a switch).

This would be an interesting project, but how would you handle bank-switched cartridges? That is to say, virtually everything that's come out in the last six years or so? :-) I can't see how a direct-to-disk copy can be performed in the first place, without some "hacking," nor how the disk-based copy can emulate the bank-switching effects without still MORE hacking. If anybody can come up with a general solution to this kind of obstacle (which I doubt; each case has the potential to be completely different) I'd be the first to say "build it!" On the other hand, even something that would copy "most" carts to disk would be handy.

>Has this already been done? My intent is not for piracy,
>just for backup & execution from disk. Is this something
>that you'd like to see in the archive?

I know/think there's something like this for the C64, but I've never heard of anything similar for the Atari...

In article <1992Jan27.172159.28008@umesve.maine.edu>
deej@thrush.umesve.maine.edu (Dj Merrill) asked for technical information on
the Atari joystick ports. I hope the following helps.

PORTA I/O lines -- Joysticks 1 & 2

```
6520/6820 --------/\/\/\------+-------------> to joystick
I/O line 150 ohms |
(note 2) --+--
--+-- 0.001 MFD
| (note 3)
--+--
---
-
```

PORTB I/O lines -- Joysticks 3 & 4

```
+5 v O
|
4.7K ohms >
(note 1) >
>
|
6520/6820 ----+---/\/\/\------+-------------> to joystick
I/O line 150 ohms |
(note 2) --+--
--+-- 0.001 MFD
| (note 3)
--+--
---
-
```

Source: Atari 400/800 Hardware Manual
note 1: value valid for 400 & 800
note 2: value valid for 400, value for this resistor on the 800's
schematic is illegible but appears to be 220 ohms
note 3: value valid for 400 & 800

On the 400 and 800 the 5V line is tied directly to the computer's 5V supply.

A bit about the differences between PORTA and PORTB of the 6520 PIA. PORTA
has internal pullups and behaves much like a standard TTL output when in
the output mode. If I remember correctly, it is not designed to handle as much
current as a standard TTL output. PORTB has a totem-pole output which behaves
more like an HCT-type output sourcing and sinking current reasonably well.

I MAKE NO CLAIMS AS TO THE ACCURACY OF THE ABOVE FORTY-SOMETHING LINES AND ESPECIALLY NOT TO THEIR APPLICABILITY TO THE XL AND XE MACHINES.

In a recent posting here, Anthony Falcone (a.falcon@bitsy.cooper.edu - derived from his SIGNATURE at the end of his message, NOT from the incoming mail headers!) writes:

> I would like to know if _ALL_ of the information on the a8 digest
>is in the public domain... reason being that my user group,
>OHAUG, would like to reprint some info in it.

I believe it is at least "traditional" to contact the INDIVIDUAL authors of articles you wish to reprint, to obtain their e-mail-written permission to reprint their writings. I would suggest setting up some sort of automated command script on your Internet host so that you can say "aha! Interesting article, might do for a reprint," hit a key or type a quick command, and bang! -- nail off a standard request-for-reprint-permission letter to the author. Shouldn't be too hard to do.

Many, though maybe not all, groups also send reprinted authors a complimentary copy of the publication issue in which their reprinted work appears; some even give complimentary subscriptions to reprinted authors, but I can see this sort of thing getting out of hand if you do a LOT of reprinting...

Me, I don't care who reprints me, but I DO prefer to SEE myself in print. Otherwise somebody could someday descend out of the blue and start yammering at me about "that article you wrote in Blibblesnork magazine," or some such!

>Do you NETters beleive that the Atari 8bit has reached or CAN
>reach a point when All that there is to say about it has been said? When All
>that can be programmed has been programmed? Sometimes I find myself saying
>yes, only to be amazed at a new program someone comes out with.
>What do you think?

No, I don't think we will ever reach that point. There will always be new developments from other areas of computing to emulate/implement on the Atari, for one thing...

Well Oscar and others here is YOUR chance to change this. Over the last few weeks I have read with intent the discussions in this news group and from what I see you all want an 8bit magazine right? RIGHT?

Well Z*MAGAZINE is just that and over the years we have endevoured to maintain a high level of input to this journal. However when we do not get the imput and the writers it does become a little difficult. So to all in this news group if you want to contribute to Z*MAGAZINE please feel free to EMAIL your articles to kcbbs.gen.nz!status!znet or znet@status.kcbbs.gen.nz I will see they get included in the next issue of the magazine.

What are you thoughts. All of you reading this news item can get the magazine and distribute it and or hard copy it via the atari.achive held at umich.edu ..

Now you all know the story about a gift horse..

Source record: 112833

IN ADDITION to what Chris said about there always being new things to talk
about on the Atari 8-bit, I have found there to be many newcomers to the
8 bit world, who may have missed that Display List Interrupt article that
was printed two years ago... er whatever, and would like to see it again.
I was surprised to see how many questions on the internet I could answer.
On GEnie, I seemed to be the one asking the questions, and here I answer alot
of questions and ask plenty of my own. The knowlege that people possess about
the Atari 8 bit covers a wide range, I think you can always find
plenty of people who will read an authors's material as long as it is
informative, or interesting.

399. xagon and zybex, PD or Copyrighted?

Newsgroup: comp.sys.atari.8bit

Message-ID: <92028.172830JJMCWILL@MTUS5.BITNET>
Source record: 112842

Well, I just dug up my copies of Zybex and Xagon. When loading Xagon,
all it says is XAGON, M.A.C.E. Australia D. Pentecost. There is no copyright
notice, nothing. When I first boot Zybex, it says Loading Zybex followed
by "Thanks: Kevin Franklin A.ROJO (PERU)"
When the title screen comes up and that wonder ful music plays, it says,
"Programmed by Brian Jobling Graphics by Michael Owens, Music by
Adam Gilmore". Again NOTHING indicated that these programs
were copyrighted works, only contained credits to the authors. If they
truly are copyrighted, why don't they say so? The only possible explanation
would be that they were copies by some pirates who removed the copyright
notices. I am not argueing whether I should throw away a copyrighted program,
just that to my knowledge these aren't so. If they are, then would the
originator of the "COPYRIGHTED" message please let us all know how we can
purchase this program? I, for one quit illegally copying programs a long
time ago, realizing that it only hurts the 8 bit developers, and us users
as well. I don't enjoy being accused of being a pirate no more than anyone
enjoys being accused of murder. To me they are close to the same thing, one
dealing with humans, one dealing with my favorite computer.

As to your idea (also, someone elses) of just sending pretty ugly newletters, etc. WHO KAREZ!? It's a newsletter for now! It's not a flashey "oh we have money, so let's go broke printing every page in full color glossy!" magazine. I don't think us users would really give a flying **** (ahem) about what it LOOKS like, as long as we are getting a steady flow of info.

I used to make a little newspaper (barely even using my computer, due to lack of s/w back then..ya know.. WORD PROCESSOR!), and it looked pretty nice.. Had diddly s**t to do with Atari's, but I REALLY enjoyed making it. I would GLADLY contribute to this "magazine" (notice the ""s!). The only thing is I don't KNOW that MUCH about them, but I did get a compliment on my message about the Atari's graphic modes from a couple of days ago... And it wasn't like I spent much time thinking about it, or typing it on a WP.. I did it online! I guess I could do some section in it for "new-users".. or at least for the old-users who actually want to get starting on doing things.

I could except both post-mail and e-mail for questions or something.. I'd be HAPPY to help! Count me in as a contributer.. (will give me something better to do than cry over my ex-girlfriend... my 2nd love.. (guess what was my first!? ;))

402. Explorer offer

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-28 23:45:31 UTC
From: 71450.1050@CompuServe.COM
Message-ID: <920128234531_71450.1050_EHB8-1@CompuServe.COM>
Source record: 112834

Ben,

I believe that the Explorer offer is confusing. First John calls us (the Atari 8-bit users) "CHEAP", "VERY CHEAP" at that, and then he thinks that us "CHEAP" users are going to purchase Explorer for 8 pages of 8-bit stuff that is censored by the very people that don't even acknowledge the existance of the 8-bits anymore once every 2 months. I do have a subscription to Explorer, along with AIM and Current Notes, but have never been very impressed with it, mainly due to the fact that everything always seems to be going great in the Atari world according to the magazine, and also the fact that the publication schedule has been less than impressive in the past (remember the famous Spring/Summer or Fall/Winter issues instead of the bi-monthly that were supposed to be printed?).

I think that John is turning AE around for the better, but I am not convinced that the "good folks" at Atari are going to be very interested in continuing 8-bit coverage for very long in AE if they can devote those pages to the newest machines, or advertising space.

Why would Atari want to promote the 8-bits and possibly get some of those 70,000 (???) users interested in the 8-bit line again if they can draw them to a more expensive computer that is less user friendly for a beginner instead?

I must be missing the logic in the offer, if there is any besides increasing the Explorer subscriber base and then dropping or cutting back extensively on the 8-bit coverage and hoping that us "CHEAP" users will either give up and lose faith or U P G R A D E to a "better"/"real" system! (yeah, right!) :)

I think that the interest for an exclusively 8-bit publication is there, and with the help of the user groups and AIM, we can make it move. If a small but growing bi-monthly magazine like the 2600 Connection (in newsletter format) is rapidly increasing their readership, and apparently at least breaking even in the process, an 8-bit mag surely couldn't do any worse.

As for the idea that a couple of users have proposed regarding an 8-bit electronic magazine, we already have one! Contribute and read Z-Mag, which is still being published when material is available.

Also, Atari Explorer is not easy to find in these parts due to the fact that many stores that used to carry it gave up on it when the publishing schedule started being sporadic (I live in the Louisville, Kentucky area).

Finally, just for the record, I am not a "CHEAP" Atari 8-bit user. In 1991, I probably spent the equivalent of the cost of a new ST system on 8-bit hardware and software, and actively support the market as much as I can.

You have my full support for an 8-bit publication, and I am ready to subscribe as soon as the publication becomes a reality.

-Lawrence Estep

As I find the 8-bit to be a very viable platform (even if I am using an ST I picked up for an embarrassingly low price), I'd like to see any support we can get -- and Explorer is as good an option as I've heard suggested.

Jim T.

I believe there was an article in the first Happy-Computer Atari Sonderheft
(Happy-Computer is a German computer magazine and a sonderheft is
a special edition...) on how to build a general purpose banked cartridge emulator (for the
old 16k supercarts). I don't think it included software, or at
least not "back-up" software (grin). Basically, it was some 4k static RAMs
and some switches and select hardware. Would be neat, and I've thought
about building a supercart RAMdisk around some 32k RAMs I have but I probably
won't ever get around to it.

405. Turbo-BASIC for 800

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-29 00:33:48 UTC
From: buescher@irk.ugcs.caltech.edu
Message-ID: <buescher.696645228@irk>
Source record: 112836

My xl is on the fritz so I'm using an 800 I picked up for $10.
Problem is I can't use Turbo-BASIC. Now I know about Frost BASIC
and downloaded it, but it's not what I was looking for (it loads as
DOS !?!?). I know a real version of the interpreter exists for the 800,
since I used to have it (as part of the disk distribution of it by Happy
Computer) but for some reason it wasn't on my backups and the originals
are lost... Anybody out there have it?

Source record: 112783

I just got the catalog. Only hardware tho, and pretty expensive
considering that I have about $6 to my name!
I'm wondering if either Bob Puff or anyone else from CSS are on UseNet.
I am wondering if Bob would be interested in any ideas I have for any new
versions/upgrades of BobTerm. (I have 1.21, are there any other higher
versions? I saw someone meantion 1.22, but it could've been a typo. I
also have 1.01? and one other one. (of course, the two older/less
powerful ones I got via a long distance BBS or two, and v.1.21 I got
LOCAL!!! ARGH!!)

Oh well...
Any NEW ideas on software... I'm sick of BASIC
and awaiting Action!. Also, could someone send me some
UUencoders/decoders? I'd be willing to send a MyDOS formatted disk via
mail, if necessary! (tho I HATE mailing disks. Got a disk-catalog and
it didn't work! Oh well... got a printed one as well.. but disks are
soo much cooler!)

Message-ID: <H3eaFB4w164w@cyberden.uucp>
Source record: 112778

I haven't had any feedback on the disk idea for a magazine!

I'd prefer disks because it is more "user-friendly" and allows more user interaction, and, of course, keeps the attention of the "reader."

On one side could be the articles/reviews, and on the other, any software that would normally be published as "type-in" stuff in a major (as in LARGE) magazine.

I HATE type in stuff (gotten LAZY over the years!), unless it's a really small demo or something.

Another way to do it, especially since there are a few 8-bitters out there with-OUT disk drives, is to have a printed magazine that is orderable instead of the disk-based magazine. It would contain most of the same information, but fewer programs because of the limited size of print.

Also, along with my above idea of two types of subscription would be one with "paper only" and "disk and paper". The paper only would be, say, 10 pages + additional stuff. (ads?) The disk and paper would be the 10 pages on disk, + additional stuff.

Hey! Even have the software that would run the disk-based magazine INCLUDE advertisements, such as Prodigy does! :)

If you guys doing this are willing, I'd be glad to see what I could do for software. (It'd take a while, and I'd probably need some sort of bribe/deal ;) to ensure I don't fiddle around on UseNet all day and not get anything done!)
My proposal would be: You advertise/use word of mouth/whatever for the people to want to subscribe. With their first "issue", they'd receive a disk that contains a runner package. (this is for the disk-base subscription, of course). It would contain a bootable menu that would run through all the files on all the other disks they get each (or every other, or whatever) month. (This would increase the space avaliable on the other disks for the magazine itself. Instead of having each "issue" boot, it'll miss DOS, DUP, AUTORUN, and whatever else.)

If you allow me the privelege of programming this software, it'd probably be in compiled TurboBASIC. (hopefully that can run on the 400/800's?) If not, it might be in plain BASIC, plain TurboBASIC, or Action! along with a runtime package (BUT!! and this is important!: I DON'T >HAVE< Action! yet, and have no idea what I'm doing!)

So... what do you guys think? (long enough message, eh?)

I can just see it... it'd be bea-utiful!

BTW: how would one check the R-Time 8 cartridge clock from, say,
TurboBASIC, just incase I add a real-time clock to the software...?
Thanks... Bill

Source record: 112782

I forgot to meantion in my previous message...
I'd produce both some sort of display software, as well as (IF I could do it!) a creator program. This would keep you folks from having to type stuff twice. The creation program could perhaps print (or at least do a screen-disk dump and I'll let you digure out how to get it on the disk!) the file out.

To make it look REALLY good would be difficult in the beginning (tell my damn mom to shut up!!!).. where wuz eye? Oh.. but, I guess you could send an "upgrade" disk ever-so often when the software becomes better.

I'm not sure how much it would cost to do this, but I'm sure there has to be people out there with some high-speed drives that could copy the disks for you, and also, disks can cost as little as .1c I think.. or was that 10c? Yeah... 10c.. ($.1, not .1c!)... You could buy 1000 for $100.. not bad! Considering you'd charge about $1-3 or more? for the stuff...

So...again, I >want feedback!<

Tell me what you folkz think and any new ideas or
negatives you got for me... c-ya! Bill

If I had stuff to upload... I do have some stuff like a reasonably nice
mandelzoom program that came with Turbo-BASIC XL (I was living in Germany
and actually ordered the disks from the issue of the magazine that published
it). Is all that stuff in the ARC file w/turbo basic? Anyway, the reason
I posted this was more or less that I was hoping someone with stores of
picture disks,etc. would upload stuff. (especially stuff in APACVIEW
format)

There was something made like this for the Atari at one time. I know because an old Computer Science teacher of mine had one. He said it was up in his closet. I asked him if he would mind selling it. He didn't seem to like the idea too much so I never followed/bothered him again with it. BIG MISTAKE... I wish I had now. Too bad I don't livew3 there anymore 8-(.

When you receive an info kit, there is a box on the post-card whick
you can check, indicating you would like to contribute to the magazine.
Go ahead and check it, as all this data is entered into a database.
Then it is easy for us to look up contributors and see how many people
are willing to contribute and look them up and see how their articles
are coming along. That's the plan anyway. Do I have your address?

423. Using util, atario21

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-29 17:42:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GFVY2854NK8ZE7MK@carleton.edu>
Source record: 112854

My father is trying to use util and/or atario21 to write Atari format disks with his PC, but without success. He writes to me:

I have been unable to get supunarc.com written to an atari disk using arati-pc (util). All it will write is 4 bytes and then it stops. I got the source from terminator by direct ftp twice. The first time a got the .uue version and decoded it. The second time I got the .com version. The decoded .com version and the straight com version both ended up as 10279 bytes on the pc. I'm out of ideas. I transfered both as binary.

By the way, I ran atario. It is an Atari ==> IBM PC file copier in that it will read atari disks in a PC drive and copy them to another PC drive. I could use it to send you an atari file, but I see no way to make it write a file residing on a PC to an atari disk. Get it and have a look for yourself.

Is it true that atario21 only reads Atari disks, doesn't write them?

Please contact me if you can help out.

Michael

Yeah, but it's easy to fix. The fourth part, about 107 lines into the file (including USENET headers), the line has an extra 'b' in the beginning of the line. This makes the line one character too long, and really screws things up. Just remove this character before you attempt to uudecode. I haven't used DISKCOMM 3 on it yet, but uudecode has stopped complaining about bad checksums.

425. "daisy chain", modem, printer

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-29 20:11:26 UTC
From: phile@pwcs.StPaul.GOV
Message-ID: <9201292011.AA12362@pwcs.StPaul.GOV>
Source record: 112761

I am going to be using my 800 at home more for telecommunications in the near future. I have the SX212 modem from Best Electronics. The SX Express program docs I got with the disk and cable say I need an XE or XL. Seems to run just fine on the 800 so far, although I do not yet completely understand what I am doing.

The SX212 modem plugs in to the "daisy chain" of SIO(?) cables. It has only one SIO port on it, so it wants to live on the end of the chain. Trouble is, I have a dot-matrix printer running through a parallel interface. You guessed it, the parallel interface also has only one SIO port on it and also wants to live on the end of the chain. I want to have the printer online so I can take advantage of the "print screen" commands and the like.

Is there a three-headed cable somewhere? A "Y" adaptor? A box with just three of these SIO ports would do it.

Email to this account, please, as I don't often get the time to read news.

On a similar note, when I installed the US doubler, I just switched
a 1 or 2 chips. (I can't remember for sure, this was 4 years ago!)
Anyway, were they just ROM chips, or something else? (What did these
chips actually do?)

Thanks....

427. Atari Classics/Campaign Update

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-29 22:44:10 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9201292244.AA00352@smithkline.com>
Source record: 112759

********** ATARI CLASSICS **********

********** CAMPAIGN UPDATE **********

Looks like sentiment is still going against the Explorer proposal. <heh>

For you Eager Beaver types who are all set to charge off into the sunset with your printer spewing out page upon page of articles for Atari Classics, my recommendation is: keep yer britches on & yer powder dry. Your chance will come soon enough, when you get your Information Kit & can check off on the return card exactly what things you'd be interested in doing.

For those of you who elaborated your theories of how the magazine should be organized into different departments, etc., be aware that those ideas are pretty much parallel to my own & have been duly noted.

Relatively little planning has been done on the magazine itself, because at the moment Jeff & I are focusing our resources completely on getting the mail-in campaign off the ground. At this moment some 300 information Kits are en route to Jeff. The big holdup right now is mail. One critical shipment was so large I changed it from first class to 4th class to save postage. Big mistake! I shipped it on the 21st, as of today he still doesn't have it. Bummer. I sent another partial shipment to him on the 22nd via UPS, he got that yesterday but that one had no cards. Moral of the story: from now on I ship all Kit materials to Jeff via UPS! Be patient with us folks, neither Jeff nor I ever had any experience doing anything like this before, wer'e "learning on the job". Once Jeff receives my "snailmail" package he'll be able to begin catching up the backlog of mass mailings that are building up. The package that went out on the 21st actually was going on the 20th, but couldn't because the post office had a holiday (Martin Luther King) which set us back yet another day. Arrgghhh!

Arrangements are in the works for material to fill the first issue or two of Atari Classics. I'm not at liberty to say much about that just now, it's a delicate issue. It will be a good month before I know what fruits that effort will bear.

Several people outside the USA are expressing interest in participating in the Campaign. If you'll recall, originally the Campaign was to be directed to US addresses only. However, Jeff & I are in process of working out an arrangement to enable direct participation by non-USA residents. So, you guys in places like Canada, United Kingdom, New Zealand, or anyplace else English is spoken, stay tuned for an announcement from Jeff or me about this. Our philosophical committment to the idaea is established, it's just the practical details that are being thrashed out.

The mail campaign is taking off like an overloaded airplane. But once wer'e in the air, that extra fuel is gonna takes us a long way.....

I have the same, problem, albeit with the posting. Maybe the author could put a good copy on the archive.

BTW. As far as I know, there is nothing you CAN'T upload to a.a.u.e as long as the author of the software gives his OK.

To: phvax::poehland
CC:
Subj: Re: Explorer Proposal

As I've said before, I'm against the proposal. Why you ask? Because I
just can't see Explorer interfering with OUR creativity. They will
proable limit our space, Edit our words, Shade the judgement, ect.
What are the other avenues? Just how hard is it going to be to make our
own magazine? I've read Explorer once. I never picked up another magazine.
I agree with most people... I _REALLY_ don't want to wade through pages upon
pages of ST stuff just to find the smallest smigin' of 8-bit related material.
I want to be able to send in *any* upgrades for the Atari as long as it spurrs
more interest/Ideas. If the Explorer is the only way to go then so be it.
I would just like to see us at least try to make it on our own 8-). We're
ophans now, Right?
What about deviding the Mag. into sections like someone suggested?
Have 1 Head_GUY {BEN?} do the main editing and then have 6/7 other people
do the other sections such as HardWare Hacking. Make it so that *ANYONE*
with a complete Idea can include his/her article in the Mag.

I feel better...
John

430. Re: Modifications on 800XL/1050 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-29 23:31:25 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <53638@cup.portal.com>
Source record: 112763

The modified drive probably means a US Doubler or Happy or DT etcetera
so it'll read/write 256 byte sectors. The only program I know that has
to have true double density is for transfering files to IBM's.
As far as memory upgrades go I'd reccommend a Rambo or go through Innovative
Concepts for one of theirs. The old Newell 256K works with everything but
Sparta DOS 2.3 & 3.2, but I'd get the Rambo instead, more stuff supports it.
There's a new Newell upgrade to 1 meg, but I havent checked it out. BTW: as
far as I can tell, Envision will not work with any of the upgrades.

I tried to do something like this a long time ago, but I didn't spend enough time to complete the project. I think the current is about 100-150 mA. Don't quote me on this, because it's been a year or two.

You could always get a multi-meter at Radio Shack to check (something like $8-$20).

From: reynolds@fsg.com
Message-ID: <1992Jan30.063113.24666@fsg.com>
Source record: 112774

I have an old MPP-1100 modem (300 baud) for my 800. I would
really like to use my Hayes clone 2400 baud modem, or just connect the
800 to my ST with a null modem cable. (I want to do this as cheaply
as possible.) Does anyone know if it is possible to build a serial
cable that will work with the MPP OS ROM that redirects R: to joystick
port #2? As I recall the MPP documents don't include a pinout. (the
cable was hardwired right to the modem) Does anyone have a R: handler
that works with programs other than those supplied by MPP? I never
had any luck getting anything but Smarterm (from MPP) and VT10^2
(which has no file transfer) to work with the MPP OS ROM and the
MPP-1100.

Thanks in advance.

439. An 8-bit magazine?

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-30 08:03:27 UTC
From: polari!mrp@sumax.seattleu.edu
Message-ID: <1992Jan30.080327.2584@polari.uucp>
Source record: 112710

I've been reading the various messages about adding an 8-bit section to Explorer, Z-Mag, and other options. Perhaps it's because I've been out of the 8-bit scene for so long, but isn't there a more obvious answer: expand an 8-bit user group publication to support nation-wide or world-wide readership.

Back when I was still following 8-bit issues, MACE was a big name. In time, SPACE (my local group) got pretty big, too, and I know they still put out a good monthly newsletter with plenty of support and information for 8-bit users. Why not just expand the readership and contributors to one of these types of publications, and (maybe) raise the subscription cost to cover "slicker" publishing (full-color covers and a page or two)?

But, then again, maybe I'm being simplistic. Comes from owning a Mac.

I've got a REALLY old 800 (so old that the "tell the manufacture date by the serial number tip doesn't work) that still has the A version of the OS ROMs in it. I'm tired of playing M.U.L.E. with all the GR1 text upside-down. Is there any place that still sells the B/C upgrade ROMs and does anyone install them? I have little experience with soldering, although I could probably recruit a friend...

>I hope that T2600C doesn't GIVE AWAY EVERYTHING, HENCE REDUCING THE VALUE
>OF THE GAMES PURCHASED FROM say $20-$40 down to >$0<! LiKE NINTENDO
>PUKER!! I mean Power!

Yes, the 2600 is still alive. The 2600 Connection is not something
like Nintendo Power or Electronic Gaming Monthly, it caters more
toward video game collectors and nostalgia buffs, plus those people
who don't necessarily believe that newer = better. Did you know
that the designer of 2600 Missile Command marketed a game *himself*
and only 60 copies were produced? Remember the promotional games
Chase the Chuckwagon and Kool-Aid Man? Did you know that Sinistar
was supposed to be released for the 2600? T2600C is a gold mine
of information.

T2600C *has* printed solutions for some of the games which actually
have them, sucb as the Swordquest games and Raiders of the Lost Ark.
But bear in mind that most 2600 games can only beaten through sheer
skill and not some stupid secret codes for invincibility. Nintendo
players seem to want eveything handed to them on a platter. ("Heck,
I bought the game so I deserve to be good at it.")

Just to give you an idea of the T2600C's content, here are some
articles from recent issues:

Interview with Steve Cartwright, Game Designer
Rare and Collectible Games
Programming the 2600 (three part series)
Interview with Alex DeMeo of Absolute Entertainment

plus some reviews of recent releases in England and Australia,
and an ongoing definitive cartridge list. Upcoming issues promise
an interview with the designer of Adventure and part II of the
Rare and Collectible Games article. The amazing thing about this
newsletter is that it actually puts some life into a system which
most people think died in 1984.

Anyway, if you want a sample issue just send a first class stamp to:

The 2600 Connection
P.O. Box N 664
Westport, MA 02790

I am not affiliated with this publication in any way, but I have written an article for them which has not yet been printed. I am not receiving any sort of compensation for it.

Anybody involved with Atari Classics should give The 2600 Connection a look.

That's great! I was thinking of doing much the same thing. The program
could scan the PC hard drive and make a pseudo-directory structure for the
Atari, either in memory or on the drive. This would be especially easy on
SpartaDOS (possiblity MYDOS as well, I haven't used it much).

Now if only I had some free time or a life....

Obviously there is a lack of communication and distribution at work here. I have both Xagon (from some time back) and Zybex. I downloaded both (probably from CI$ or GEnie). I thought these were public domain! Not only were they distributed as such, but I don't remember seeing any sort of a copyright notice anywhere in either game. If these games and others are commercially available through outlets in the UK, then whomever has the rights should let us all know and provide some way for US consumers to get a hold on these great titles!

Hmmm.... who put the demo on the archive? Was it taken from what I posted a
few days ago? I put all of the UUENCODEd stuff together after I posted it
to be sure it worked, and it seemed fine.

Now that I've got access to BART again, I'll try posting it directly there.
Maybe there was a translation problem leaving my node or something. (I'm on
an e-mail only site).

>pages on disk, + additional stuff.
>
Gee, guess what? This sounds like just the OPPOSITE of what A.I.M.
does. They have a magazine, and you can optionally order disks full
of software each month. This way you are guaranteed to get ads too,
which help lower the cost of the magazine. Since we are proposing the
8 bit exclusive publication idea to A.I.M., Atari_Classics could
perchance have a disk subscription as well.

>BTW: how would one check the R-Time 8 cartridge clock from, say,
>TurboBASIC, just incase I add a real-time clock to the software...?
>Thanks... Bill
>
You load the handler and do standard XIO calls to it to get the time and
date into a string or something. I haven't actually done it, but it is
all documented in the RTIME8 manual.

```
>
>> Does anyone have the specifications or the instructions for
>> modifying the 1050 disk drive? I noticed that some programs cannot use
>> an "unmodified" 1050. What does this mean? Also, I would be interested
>> in any information about specific companies that supply memory upgrades
>> for the 800XL, and how to install those memory upgrades.
>

A modified 1050 drive is never a homebrew project, rather a purchased
upgrade for it. The US Doubler made by ICD gave the 1050 disk drive
the capability to read and write true double density (180K per disk)
and also with the proper software, would also increase the data trans-
mission speed to/from the disk drive dramatically. Other modifications
which are more expensive include the Happy upgrade, which I think
B&C might still sell. This does the same as above, but also
allows archival back-up of protected software. For your own personal
use only of course. CSS also sells the Archiver, which I THINK
also does this high speed I/O and gives double density capability.

Memory upgrades for the 800XL seems to be another Frequently Asked
Question. Several sources carry differing sized upgrades for the 800XL,
each one with differing amounts of true compatibility with the 130XE
and it's antic modes. Once again I will give a quick run down.

Newell industries sells a 256K upgrade. They also sell a 1088K upgrade
which can also handle 4 MEGS of RAM. SpartaDOS will only recognize the
first 1024K for RAMDISK, whereas MYDOS can/might have been modifies
by Newell Industries to give you (4096K minus 64K main RAM)
for the RAMDISK. Newell Industries distrubites the latest version
of MYDOS with all their memory upgrade products.

Innovative Concepts sells a 128K upgrade for the 800XL, which boasts
true compatibility with the 130XE. This means the ANTIC can be told
whether or not to see the extra RAM as well. This need only be critical
in some programs, very few in fact, like Typesetter XE.
I can't remember if they sell a 256K upgrade as well or not.
Their upgrades come with a disk full of RAMdisk utilities and stuff.

Computer Software Services sells a 256K upgrade for the 800XL boasting
once again, true compatibility with the 130XE. It is more expensive
than most other upgrades, and requires installation by them.

ICD Sells (SOLD) the Rambo XL 256K upgrade for the 800XL.

There are various public domain 256K upgrades for the 800XL out there
somewhere. Claus Buscholtz did one. I might have the docs here
```

somewhere. Similar to the Rambo XL.

There are probably others. Wasn't there a Peterson Upgrade?
I hope this helps!

>
>The old Newell 256K works with everything but
>Sparta DOS 2.3 & 3.2, but I'd get the Rambo instead, more stuff supports it.
>There's a new Newell upgrade to 1 meg, but I havent checked it out.

Not true! I have a Newell 256K in my 1200XL. Use RDNEWELL.COM instead
of RD.COM supplies on the disk and it works fine. I use the 1088K
all the time, and it works with just about any RD.COM file, and
SpartaDOS X. SpartaDOS X also recognizes the Newell 256K upgrade.

450. 1200XL vs. 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-30 17:44:43 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92030.124443JJMCWILL@MTUS5.BITNET>
Source record: 112795

Someone wrote asking about the 1200XL, versus the 130XE. I didn't catch
the name as it was in the Info-Atari-8 newsletter, not on the C.S.A.8.
I have a 1200XL, and I've seen and read much about the 130XE, and here are my
views upon the 1200XL.

The 1200XL came out somewhere before/after the 600XL and 800XL. I think it
was before, as it does not have the Parallel BUS. On the other hand,
the 1400XL and 1450XLD which are even rarer, much rarer, do have the
Parallel Bus. This leads me to believe the 1200XL was after the 800/400
but before the 800XL/600XL series. Perhaps I am wrong.

But the fact stands, there is no Parallel BUS on the back, which means you
can't normally plug in the BLACK BOX or ICD's MIO or whatever else.
Now Bob Woolley of the San Leandro Computer Club is a BIG FAN of the 1200XL,
and has done a Parallel BUS modification to it. I haven't done it
to mine as yet, since I mainly use my 800XL, and I don't currently have any
PBI peripherals to plug into the Parallel BUS.

The 1200XL has a much better keyboard than either the 130XE or the 800XL.
The computer itself looks like a 800XL, but it is deeper. Function keys
are on the row of the keyboard. These include RESET, SELECT, START, OPTION,
HELP, and F1, F2, F3, F4. These function keys normally act as cursor control
keys, but can be redefined through software if a programmer so desired to do so
They also allow you to lock the keyboard, turn off the ANTIC chip, which
blanks the screen, switch in the universal character set, and something else
I can't remember. Back to the keyboard, It is like an 800 keyboard
in touch and feel, but I
think is surpasses the 800 keyboard as well. The cartridge port is on the
left side of the computer. One cart. plugged in will actually be recessed into
the side of the case, hiding it from normal view. I currently have
the RTIME8, SpartaDOS-X, and BASIC XL plugged into mine.

The 1200XL contains an Operating System similar to the 130XE and 800XL.
There is no internal BASIC. These can be changed. Part of Bob Woolley's
Parallel BUS upgrade also includes installing the 800XL operating system
into the 1200XL, because this Operating SYSTEM contains the Parallel BUS
handler code. Optionally as part of his upgrade, you can also install the
REV. C BASIC ROM chip into your 1200XL, making it just like a 800XL/130XE in
that respect.

The 1200XE doesn't have +5v output on the SIO port, preventing it from
powering P:R: Connections, XM301 modems, Printer Cables, etc. This is
fixed with a simple short across a resistor.

Memory upgrades for the 1200XL include 256K by either ICD's RamboXL or
Newell's 256K XL, or 1088K/4 MEG by Newell's other upgrade board.

All in all it is a really nice machine to own. Since my 800XL is currently down (blame it on cheap IC sockets.), my 256K 1200XL is now up and running and the keyboard feels great, although it is different than using the IBM keyboard I had plugged into my 800XL!!

Shawn,

MyDOS takes up only slightly more disk space and RAM space than
DOS 2.0 or 2.5 (maybe 1k more?). It runs at least as fast (and
probably faster on certain things) than DOS 2.0/2.5, and does
support RAMdisks and hard disks. I have it running on my old 800,
where it works fine talking to my XF551 and 810.

453. DRAWTO command

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-30 18:45:11 UTC
From: a.falcon@BITSY.COOPER.EDU
Message-ID: <9201301345.AA01579@bitsy.cooper.edu>
Source record: 112787

I was asked to investigate exactly HOW a computer draws a straight
line on a graphics screen, and possibly make my own routine in C.
I thought "No Problem": I could modify the GR.7 drawing program in
INSIDE ATARI BASIC to draw in GR.3 and figure out the
the pattern/algorythm the ATARI uses when implementing a DRAWTO
command. I definitely found a pattern.... BUT I can't figure it out!
Drawing horizontal/vertical or perfect diagonals doesn't present
too much of a problem. However, it's the lines inbetween these exceptions
that I can't figure out: how DOES the computer figure out where to plot
the next points? As far as I can tell right now, it doesnt seem to be
directly related to slope, but seems more of a mathematical progression.
I beleive the answer lies in dissasembling the OS or BASIC to
find the DRAWTO command, but even if I could dissasemble them, I can't
read machine language.
Any help is greatly appreciated. Thanks!

For the record, somebody (Ray Wilmott? or Curt Wilbar? or Bob Sinclair?) once sent me a big long message thanking me, mistakenly, for "creating" the UTIL PC-to-Atari-disk program, and delineating the exact nature of its flakiness, i.e. the conditions under which it works/doesn't. I'm in the process now of "keeping an eye out" for that analysis so that I can post it here, but the only thing I remember off the top of my head is that it makes a difference whether you specify the command-line "slash-letter switches" in UPPER or LOWER case... I don't remember which works and which doesn't, just that one DOES and the other DOESN'T...

>used DISKCOMM 3 on it yet, but uudecode has stopped complaining about bad
>>>checksums.
>
OK, I have used DISKCOMM 3 on it, and the demo is pretty cool. Especially the
digital music demo. Hit the space bar or start to skip demos (it depends on
the demo), and then, when the screen appears that says at the bottom,
option=english select=netherlands
push the language of your choice, and WAIT through the whole message.
Then, at the end, when the message says push start, do so and hear
some COOL digital music.

BTW, you have to unpack this onto a disk formated for 1050 enhanced density.

You might try checking the fourth file. About half way down thier is a
extra character (you'll see an '!' sticking out). Just remove the first char
(a 'b') and that should fix the problem.

Someone here in Novato, CA just got an Atari 8-bit and RadioShmuck Model 100 lap-top, and called me saying a sysop of a user-group/bbs told him to call me (I feel special!). He wanted to know how he could hook the two up, etc. etc. That's not the point, tho. The point is: HE GOT 2 1050 disk drives (used @ a flea market/garage sale) for $>>>5<<< a peice!!!!

The reason: The seller called Atari and asked how much they were worth... the answer: "They're not worth anything..." !!!

That does it! I'M GONNA KILL THEM AND TAKE OVER!!

Oh well... He also traded in one of them (got 2 or 3?) for an 800xl w/256k! He also got the Model100 for $70 (with TONS of stuff built in.. he said it would probably have been worth about $2000 new back in '83!!!)

Some people around here!
Oh well, at least there's another user in Novato!

Sounds like you do have an XF551 (that the #?) It seems that all the
XE/ST/TT stuff (the Tramiel era) has that grey color and is sleeker and
has those diagonal vents and parralelagram(sp?) buttons.
You can also easily recognize XL stuff (including the 1050, 1010, etc.)
because of it's white-tan / dark brwon color, and it's funny looking
vents all around (even the 1010 has them, but no USE for them!). The
400/800 (810,etc.) all look alike, too. They have that greyish color (if
I recall?) and the orange (like the ConsoleButtons) and all that..
I find it sort of interesting that they all look the same
depending on the era... ? Bill

I don't know San Leandro Atari Computer Club's address, but the phone
number is:

415-887-2008 (It's in California, USA) I have the name Keith Sammons
above it, so I'll suppose that he's head of it?

INTERESTING!!! I got Zybex from ATARIBASE! And they are AT ATARI!!

Hmm... that's funny. Also, I always sort of wondered WHEN Zybex was
made? On the title screen it just has three names of the authors, no
date or nothing...?

(oh great.. now I have pirated stuff!)
Hmm.. I'll stop (did I ever?) uploading it.
(I think I did, but that place's hard drive crashed..
of course I happened to be in charge of the now COMPLETELY empty
8-bit section! Life's a bitch, and then you die...

CSS makes the following for the 1050:
Super Archiver I & II
The Bit-Writer
Silencer

there's also the US Doubler (I forgot who from?) and the Happy Upgrade.

That's about all I remeber for the 1050. Also, what software do you
have? I have a TON of stuff, and a stock 1050.. no problemo!

As for the mem. upgrade... there are tons.. Newell makes up to
1088k-4096k (yes, 1-4 meg!) upgrades. There are also Rambo XL (256k I
think) and a bunch of others I've seen and forgotten..
Hope it helps

CSS's The Super Pill copies 8k & 16k (non-bank-selecting) carts. to disk.
It costs only $25.

Also, Alpha Systems (makers of the Parrot I & II, ComputerEyes, many a
book/disk combo (such as copy-protection techniques/etc.), magna print
II/II+, etc.etc.) made The Impersonator which could copy disks. All they
sell anymore for 8-bits that I've heard of is the Parrot II for I think
between $50-70? (I forget.. but around there)
But, yes.. it IS possible. Bill

I just obtained a P:R:connection for connecting my printer, since I decided
I was sick of trying to do all my printing through the XEP80. But I
wasn't expecting the DB15 port on it instead of a normal DB25 like on the
XEP80. Can I just use a DB15-DB25 adaptor to make the connection, or do
I need a whole new cable? The local Radio Shack doesn't have such an
adaptor.

The best, by far, is RVERT.COM from BobTerm 1.21 (and possibly
earlier versions, I only have 1.212), it also works great with OmniCom.

I use RVERT.COM with MYDOS and haven't tried it with any other DOS.

The SX212 handlers currently on the archive aren't as nice to work with.

Once again, Bob Puff outdid himself with this program.

Of couse we would like to discuss an 8-bit only magazine! How about AIM doing one? What do we need to do to make that happen? I was just talking to Marver (ChromaCAD) and he would much rather see an 8-bit only as a means of advertising - speaking from a developer's point of view. What does it take to put out such a publication?
Bob Woolley

BobW,

It really depends on what you want out of a publication before I can say what it takes to put one out.

What's important? Distribution to national bookstore chains? A monthly 8-bit only newsletter going to subscribers only? These are questions I haven't seen answered in the discussion on UseNet.

Pattie (Atari Interface)

(If anyone would care to reply to the questions that Pattie has, I believe that AIM is reading these Digests, and I will forward any replies that are posted to the Atari 8-bit Forum on CIS)

481. XF551 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-31 05:16:44 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92031.001644JJMCWILL@MTUS5.BITNET>
Source record: 112711

In response to the enquiry regarding the XF551 720K 3.5" upgrades, it is possible only because Atari chose to use a standard IBM type mechanism in the unit. Bob Woolley took the ROM on the controller board, and found out how to change the ROM to work with 80 track 3.5" disk drives, and also fixed some bug in the original ROM that didn't properly allow the drive to come up to speed before attempting to access the drive. The Innovative Concepts 3.5" drive is essentially that, a new ROM which will control a 3.5" mechanism, plus the proper connectors, since 5.25" and 3.5" mechanisms usually use two different types of connectors. Modification is then a matter of replacing the connectors and the ROM chip, and purchasing a 3.5" disk drive with 5.25" mounting plates, and hooking it all up. What I did when I got mine was, hooked up a switch between the TWO ROMS, the original, and the new one. This switch also switches a control line on the data cable going from the XF551 controller board to both the 3.5" and the 5.25" mechs. So by turning off the drive first, I can throw a toggle and access my 5.25" if the need arises.

Computer Software Services has taken all this further. I haven't seen the upgrade personally, nor have I read any reviews of it, I can only go by what I read in their catalogs. They apparantly also have modified the ROM code in the drive to enable it to read IBM/Atari ST formatted disks. Furthermore, they have an option where both your original 5.25" and the 3.5" can be accessed simultaneously, without flipping a switch like I do on my upgrade.
If you set the 3.5" drive as drive #1, then the 5.25" automatically becomes drive #2. The 5.25" is always one drive number higher than the 3.5". This sounds great, and I really wish I could pick up this upgrade.

BUT, since the Black Box is now coming out with that new floppy controller board that can handle 360K, 720K, 1.2M and 1.44M drives at much higher data access rates than even an UltraSPEED 1050 can do, that seems to be the most awesome way to go.

Realistically speaking however, given my current budget as a college student, it's likely I won't see either piece of hardware for a while.

The 1050 uses a much more complex controller than the XF551 does, and it does not use a standard IBM mechanism. I suppose this is why it hasn't been modified for 3.5" drives and such.

Is this the same Atila Forth that was used in the writing of the book
"Library of Forth Routines and Utilities," by James D. Terry? The blurb
in the back of the book talks of a version for the Apple II, IBM PC,
Atari 520ST, Amiga, Commodore 64/128, and Apple Macintosh.

484. Forth on the 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-31 12:59:38 UTC
From: dh108@cs.city.ac.uk
Message-ID: <1992Jan31.125938.24180@city.cs>
Source record: 112715

Whilst I was using Forth a few years ago, E.S. Forth by English Software,
I brought the book for reference:

'FORTH' by W.P. Salman, O. Tisserand
and B. Toulout, published by Macmillan.

In section 1.4 of the introduction (page 4) the following paragraph appears:

Remaining in the field of entertainment applications, we
should mention the experience of the Atari company that
developed a system of tests for arcade games using FORTH
on a 6502 microprocessor. New arcade games now appearing
on the market function in FORTH. Atari are also developing
their home TV games in FORTH and already offer a version
of FORTH called GameFORTH for their Atari 800 home computer.

Does anyone have any information on GameFORTH?
Is it available anywhere? Was it any good?

Whilst I'm at it - did any of these three titles ever get released
in the U.S. as they were 'promised' over here:

Winter Olympics (Epyx), Impossible Mission (Epyx), 10th Frame (Accolade)

If not, who could I get the conversion rights for Imp. Mission from?

Thanks,
Mark.

I think you need a whole new cable. You can order your own connector
and build it yourself using the PIN-OUTS in the back of the manual,
or order a P:R: Connection/Atari 850 cable from an Atari 8 bit vendor.
Even the RS232 is different. But that can be made from an IBM
AT->RS232 (9 PIN -> 25 PIN) adaptor, and one of Radio Shack's joystick
extension cables, and I think an extra DB9. Just think of it as fun and
experience playing "match the color-coded wires" and soldering. :)

I'm a member of a german Atari 8-bit user club (Atari Bit Byter User Club
e.v.= ABBUC). We have an 8-bit Mailbox (0-2400 Bps,Tel.:+049/2366/39623).
This Mailbox has a Netconnection with another Box in the Netherlands.
Now we're looking for for a Box in the USA to join this Network.
Our Box runs on an Atari 800 XL with BBS pro and it was the best if your
system has the same software.
If you are interested in this give me mail to the address in the haeder.
I hope to heare from you!

>
>What res!? I've READ that the 7800 can be 320x???, but is that like in
>text mode pixels, and gr.8 pixels?

The resolution is the same as the 800, and the 3200x200 can either be
text or graphics. Wait, that's misleading; on the 7800 *everything*
is a sprite, and you can arbitrarily bop things around as you please.
You can do all sorts of neat stuff like overlay text modes and graphic
modes ON THE SAME LINE. The hardware is really cool, and I'm planning
on writing a game or two for the thing, time permitting. Oh, as for
colors, you can have up to 25 per scan line (chosen from 256 total).

>Where can I get a 7800?

Send $1 to:

Telegames USA
Box 901 V
Lancaster, TX 75146

for a catalog and mention that you are interested in the 7800.

Once again I'll mention that I have nothing to do with this place.
They sell brand new 7800s with two controllers for only $39.99.
Definitely worth it, especially if you are a fan of Xevious, Robotron,
Asteroids, or Joust.

Sorry about that, I misspoke, I should'a said doesn't work with RD.COM
The omission of SDX from the non-working was intentional since I have one
that I use with a Newell up-grade. I should add, just for lurkers, that
Tim Patrick wrote a ramdisk program that'll recognize what type of
up-grade you have & install properly. It works with Atari DOS 2.5 for
people that don't want to use anything else. I think it was in Antic.

IMHO: An 8-bit magazine would need national distribution to bookstores like B.Dalton's and WaldenBooks. There are TONS of 8-bit owners out there that have been stranded by the publications. If an Atari mag would show up on the newsstands, I think sales would be more than one would expect. Considering that Atari Explorer is the ONLY mag that I EVER see on newsstands, another magazine is definitely needed!

I also believe that Bill and Pattie Rayl cannot be the editors. From what I gather, they are quite busy with AIM. Perhaps another editor can be found that will work under the AIM banner on this 8-bit mag. Hmmm, the name "Poehland" suddenly comes to mind. :^)

493. Atari games released into PD?

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-31 17:47:21 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Jan31.124721.8751@miavx1.acs.muohio.edu>
Source record: 112681

A while back people were talking about the copyrights of programs,
and trying to get them released into PD. I would like to know what is
Atari's view of their own software. It would be great to be able to
download Star Raiders or Ms. Pac Man.

Also, I'll be getting a EPROM burner soon. My 800XL has BASIC Rev.
B in it. I've got the patch to bring it up to Rev. C, and I would like
to burn my own Rev. C ROM. Has anybody had any experience in doing this.
Would this be legal?

Later.......

It loades as DOS!? .. Do you mean it's named as DUP.SYS, or what?
That's the trick I use with MyDOS because it can't (or at least I don't
know HOW to) load AUTORUN.SYS's at boot... (BTW: Anyone know how to
overcome this?) If FrOst Basic is named DUP.SYS, just rename it
too AUTORUN.SYS (if you have DOS 2.x, or anything that'll boot to
AUTORUN..) and copy DUP.SYS back on the disk... Or not.. maybe just
re-WRITE DOS... I've noticed that copied DOS's take a LOT more room! Is
this because the rest of DOS is hidden on the disk!? (this is with 2.x,
I haven't noticed anything/tried anything with MyDOS...)
thanks for any tips/info Bill

I have a couple of groovy font demo.'s that I'm gonna upload once I
figure out how.. They make a 160x192 (IRG 4, multicolor, GR.12, etc.)
text mode, but the text looks a lot like normal mode (320x192), and you
can even change colors. Inverse is sort of bothering, but'd be nice for
different colored high-lights, such as for a spreadsheet...

As for music, >I'm< still waiting for stuff! I might purhcase
Digi-studio soon, because he's (the maker... sorry! forgot his name!)
going to add BASIC players and stuff.. things I need.

With pics. I HAD a bunch of spiffy digi's
(including...well...mainly..XXX), but I deleted most of those because...
well.. err.. waste of space...that's it! ;) (can always UnDelete!)

If someone were kind enough to download pics (many are not-copyrighted
anyhowz) from BBS's (sorry...like I said...all my kinky ones are gone :(
) and upload them to the archive, that'd be pretty nice..
Happy Hunt'n
Billl

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <c3JFFB10w164w@cyberden.uucp>
Source record: 112661

About that Draconus game (or whatever it's called.. somebody help me OUT here!!)... I'm wondering if it has game music. I LOVE Zybex's music, and actually impressed the a**h*** IBMer's around here with the sound. The thing I miss, though, is like in most of my brother's C=64 games that Zybex reminds me of, the game music. The sound fx in Zybex are ok. Nothing too special, you know. I LOVE the fact that it doesn't ever need the disk drive after boot, but I'm wondering if there are any games of the like (good gfx/music/gameplay) that would trade the non-loading for constant music. Are there any, or are there any of you out there who could actually make a game considerably good, like Zybex, that plays music!?

Also.... for you REALLY good programmers.. How about a patch for Sega/Genesis controllers. So far, I've only been able to recognize 2 of the fire buttons, but that's one more than out little for-some-reason-highly-used Atari 1-button joysticks. (Amiga/st..they all use them.. BAD MOVE.. no offense, Atari..) The continous fire makes it a tad bit difficult to kill someone when you have only a few bullets to use (say, level 1 weapon), and they're on the right of the screen, and the bad-guy's right in front of you... Or would this make the game too easy?
Anyone good at making patches? Please reply!!! Bill

508. SIO2PC problems

Newsgroup: comp.sys.atari.8bit
Date: 1992-01-31 21:41:12 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Jan31.214112.6883@dartvax.dartmouth.edu>
Source record: 112725

just received my SIO2PC interface from Nick Kennedy and am looking forward to transfering my floppies to my hard drive. Unfortunately, it seems that something isn't working right. Version 3.0 seems to be unable to read the device ID properly unless I run version 2.5 first. With both versions, when I try to format or read a disk, the 800XL beeps out the I/O and then gives me an error 140. Does anyone have any idea what I'm doing wrong? (Or is the interface faulty?)

Please E-Mail me any suggestions and if anyone says they're interested, I'll summarize.

My system configuration:
Atari side:
800XL (unmodified)
1050 (unmodified and I tried it with and without it hooked up)

PC side:
386 20MHz
2 Megs of RAM
AMI BIOS (old)
Mono monitor
60 Meg RLL drive (using Ontrack Disk Manager 4.0)
Modem on Com3:
SIO2PC on Com2: (COM2: works fine when I hook my mouse up to it.)
Tested with both DR-DOS 6.0 and MS-DOS 3.3

Thanks for your help,
PCrow

X-Acknowledge-To: <JJMCWILL@MTUS5.cts.mtu.edu>

Lawrence,

Thanks for posting the material from CIS containing part of the
magazine discussion between Bob Puff and A.I.M.'s Pattie Rayl.
If there is any more discussion regarding the Magazine on there,
I sure would like to see it!!

With thanks,

Jeff McWilliams

Sb: #8-BIT MAGAZINE
Fm: Atari Interface 70007,4640
To: SYSOP*don lebow 76704,41 (X)

Although Bill and I don't have UseNet accounts, we have been reading up on the activity there, thanks to Don! Would anyone care to discuss the 8bit publication idea here? WE'd be happy to add our 2 cents worth! :)

Of couse we would like to discuss an 8-bit only magazine! How about AIM doing one? What do we need to do to make that happen? I was just talking to Marver (ChromaCAD) and he would much rather see an 8-bit only as a means of advertising - speaking from a developer's point of view. What does it take to put out such a publication?

BobW,

It really depends on what you want out of a publication before I can say what it takes to put one out.

What's important? Distribution to national bookstore chains? A monthly 8-bit only newsletter going to subscribers only? These are questions I haven't seen answered in the discussion on UseNet.

Pattie (Atari Interface)

We want distribution in bookstores. We have lots of newsletters as it is. How much circulation is required for bookstore distribution? Who do we bribe? (grin)

Fm: Atari Interface 70007,4640
To: Bob Woolley 75126,3446

Ok... if that's what you want, you need to stick with something that's already distributed nationally, like Explorer or AIM. Those are the two choices, really. The ST market has even gotten to the point where it's hard to get magazine distributors to carry publications, so there's next to no hope for national distribution of an 8-bit only magazine.

If the primary goal is to get on the newsstand shelves, then the 8-bit community is going to have to focus their efforts on either Atari Interface or Atari Explorer. This means that 8-bit readers will have to be willing to ignore the ST/Portfolio/Lynx content of AIM or Explorer.

It would be very easy for either publication to put all of the 8-bit articles together in one section, making the information easy to find.

Pattie (AIM)

511. Power Supplies -- Indus/800 XL

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-01 00:40:48 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1992Feb1.004048.296@magnus.acs.ohio-state.edu>
Source record: 112728

First, are 130 XE and 800 XL power supplies compatible?
Second, where can I get a power supply for an Indus disk drive, will
other Atari supplies work? If so, which?

512. Sound from monitor jack

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-01 02:51:06 UTC
From: chase@electron.rutgers.edu
Message-ID: <Jan.31.21.51.06.1992.6964@electron.rutgers.edu>
Source record: 112729

I dusted the mothballs off of my old Atari 130XE a couple of months ago and set it up next to my "other" computer, a Mac SE/30. The Mac still gets a lot of use, but the Atari demands a fair amount of attention for the great games that I have for it. I intend to do much more with it when I get a chance, but I have a problem that I hope is fairly simple to solve.

I was fortunate to get a couple of composite monochrome monitors for free from a friend of mine. So I ordered a monitor cable and hooked one up to the Atari. The cable ends with three RCA type plugs. One of them drives the monitor fine, and I have the other two dangling. My question is this. What are the other two for? I suspect that they are the composite lumina & chroma from the monitor jack. What I was (am) hoping for is that one of the carries the audio output from the jack. Is this the case? If not, is there a simple way to get the audio output out? Any help would be appreciated. Thanks in advance.

513. Das Omen Demo

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-01 03:31:45 UTC
From: omf@jab.tucson.az.us
Message-ID: <mZ5FFB5w164w@jab.tucson.az.us>
Source record: 112747

Has anyone looked at the Das Omen demo yet?? It's even better than the demo from Holland (or wherever it was from...).

Too bad the screen jumps around so badly on US Ataris. Does anyone know how difficult it would be to fix this demo for US machines? Maybe the authors can be reached.

I have the following Atari 8-bit software for sale. If you are interested in
any of the items, please send me a message on CompuServe [71450,1050], Delphi
(L.ESTEP), GEnie (L.ESTEP1), Internet (71450.1050@COMPUSERVE.COM), or on The
Atari Scene! BBS (502) 456-4292 (Lawrence Estep) and make an offer for what
you are interested in. The first offer received for each piece of software
will receive it, as I really want to get rid of this extra stuff.

Chris... send your name and address to:

Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, Michigan
48108

And request a free sample copy of Atari Interface magazine...

It's pretty much what you've suggested... originally it was
the "Michigan Atari Magazine", which grew out of a collaboration
among Michigan Atari clubs including MACE, and now is distributed
as the "official newsletter" for over 80 different Atari Users
Groups nationwide...

BobR

517. Re: DRAWTO Command in ATARI BASIC

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <53794@cup.portal.com>
Source record: 112751

Anthony Falcone posted asking for information about line-drawing algorithms.'
Specifically, about the one used in the Atari 8-bit computer.

The algorithm used in the Atari is documented in a Pascal-like notation in
the OS User's Manual which is part of the Technical Reference Notes. I
can probably find it and type the relevant parts back in here, but don't
have the time just now.

More to the point, is that the Atari doesn't use a very efficient line-
drawing algorithm. Check the Apple IIe -- a more complicated memory-to-
display high-res graphics memory organization, same CPU (more or less)
as the Atari, and it can draw lines MUCH faster. (Disclaimer: I know
NOTHING about the relative "clock speeds" of the Apple IIe and the Atari.)

Any computer graphics textbook goes into great detail about how to draw
a line on a pixel-matrix-oriented display; there are a lot of ways to do
it, some better than others, some better suited to different applications...

519. Re: 8-bit magazine/AIM (CIS)

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-01 19:25:25 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <53806@cup.portal.com>
Source record: 112752

Yes, AIM has been following these discussions, both through the reposted articles on CIS and here.

The main point in their response has been that so far there has been no specific set of goals determined, and no specific proposal generated for them to reply to.

They've also had a number of comments regarding other points that have been brought up in the discussion, most of which center around the "realities" of the situation and magazine production in general.

They're definately NOT opposed to 8-bit coverage in some form. It's just the determination of what that coverage would realistically look like that's the issue.

>Anyone have any of their games? They were the BEST programmers for the
>2600. Then came LucasFilm and then Activision...

Naw, I'd put Activision first. Then Imagic. I don't remember LucsaFilm
doing anything for the 2600. Parker Brothers was also decent, though
they usually had plainer graphics in their games. Now if you want to
talk WORST company...

> Also, anyone ever see that game where you ran in a castle to get
>crowns and vases and stuff and there was a smoke-puffing, mean-looking,
>fire-breathing dragon at the bottom of the screen trying to kill you..?

That was Dragonfire. Interesting game, though repetitve (but
weren't all 2600 games?).

Source record: 112690

AH!! I have JUST what you need! I converted (one minor change I made, actually) a Timex Sinclar 1000 line drawing routine to work on the Atari. I made it mainly to do wraparound in Logo type applications, but it is sooo slow in Basic (at least AtariBasic). I have many a routine stacked up that I almost never use any more, and I'd be glad to post them if you like (I'll list them after the routine for lines).

Here'goes!:

```
5 GRAPHICS 15:COLOR 3:X1=79:Y1=79 (mode 7.5, blue, center)
10 INPUT X,Y:A=X-X1:B=Y-Y1:C=(A AND ABS(A)>=ABS(B))+(B AND
ABS(B)>ABS(A)):IF C=0 THEN C=0.1 (get a point from the user, figure out
some whatnots, and the C=.1 is incase it is vertical, I think..maybe
horizontal..?)
12 DIS=ABS(A)+ABS(B) (find distance)
15 OK=0:FOR F=C TO 0 STEP -SGN(C)/DIS:XN=X+(A/C*-F):YN=Y+(B/C*-F):X1=XN:Y1
=YN (I guess I stopped using OK, as it is not anywhere else in the
program, so try removing OK=0 and see what happens. The rest is to start
a loop and find the new locations)
20 IF XN<0 THEN X1=160+XN (wrap around...)
25 IF YN<0 THEN Y1=160+YN (ditto.. the 160 is as not to go behind the
text window.. all these #s can be changed depending on the resolution)
30 IF XN>159 THEN X1=XN-160 (")
35 IF YN>159 THEN Y1=YN-160 (guess what!?)
40 X1=INT(X1):Y1=INT(Y1):PLOT X1,Y1:NEXT F:GOTO 10
```

This program, as I said before, will draw a COMPLETELY connected line by determining every location between the starting and ending points. I'm NOT sure if it exactly replicates DRAWTO, mainly because it was originally for another computer and was never meant to emulate ATARI's drawto, but it's good enough. You might use it for pattern drawing in a paint program. I also have a BASIC recursive fill (very interesting to watch), that is NOT like ANY other fill >I< have ever seen (Mac, Amiga, IBM, Atari's delta drawing, Atari's FILL/XIO, TurboBASIC's PAINT)... That, too is good for pattern painting. I'll only post it if anyone wants it.

The other routines I have include:
PLOT A LINE (above)
FILL USING PLOT and DRAWTO
SNAKE LINE (can eat up memory, as would FILL)

I've also aquired a few assorted ML routines and a big list of memory locations that are very useful (even made it before I got DeRe or Mapping!)

Bill

524. Re: 1200XL vs. 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-02 00:59:20 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <LLsHFB4w164w@cyberden.uucp>
Source record: 112685

Here's a rundown on the F-keys on the 1200xl (BTW: I read somewhere,
I think my XMM801 manual, it said Press CTRL+F to change character sets!
Opps! CTRL+F4!).
F1 up
F2 down
F3 left
F4 right
with shift
F1 home (top left of screen/text window)
F2 bottom (bottom left of screen)
F3 carrage return (NOT with line feed! Moves cursor to left of line)
F4 right of line (opposite of F3)
with control
F1 lock all keys but CTRL+F1 and RESET (and break?)
F2 blank screen (ANTIC off)
F3 click off
F4 chset (from non-int to int.. from int to normal.. that is, if you have
a homemade chset on, when you first press ^F4, it'll go into
international mode)

PEEKing (764) will NOT give you values of up/down/left/right arrows for
the function keys (mainly because the arrows already have the +128 added
because of the CTRL key. I believe that you can use SFT+CTL with the
F-keys. I never use them because Atari was an idiot and only made them
on the 1x00xls..

Anyone out there have a 14x0xl?

Also, because of all the quirks that Jeff mentioned before, is it at all
dificult to add the IBM keyboard upgrade? I've been asking around for
cheap new/used keyboards..

thanks- bill

```

Of couse we would like to discuss an 8-bit only magazine! How about AIM doing one? What do we need to do to make that happen? I was just talking to Marver (ChromaCAD) and he would much rather see an 8-bit only as a means of advertising - speaking from a developer's point of view. What does it take to put out such a publication?
Bob Woolley

BobW,

It really depends on what you want out of a publication before I can say what it takes to put one out.

What's important? Distribution to national bookstore chains? A monthly 8-bit only newsletter going to subscribers only? These are questions I haven't seen answered in the discussion on UseNet.

Pattie (Atari Interface)

(If anyone would care to reply to the questions that Pattie has, I believe that AIM is reading these Digests, and I will forward any replies that are posted to the Atari 8-bit Forum on CIS)

-Lawrence

ARGH! No WAY! My dad's gonna kill me as it is for calling LD so much!

The idea's I have are:

1) arc/unarc modules for BobTerm
2) START instead of ESC (and a lot of times any non-listed buttons) goes
to main menu.
3) Ability to save captured mem. twice.

Other than those 3 "complaints", I think it's about PERFECT!
(even better than a lot of hooey I've seen on those damned IBMs!)
Thanks for the #,
tho.. I MIGHT call?!?!
Bill

529. 80 column TurboBasic program

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-02 01:11:39 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <56sHFB1w164w@cyberden.uucp>
Source record: 112693

I'm currently working on an 80column program in TurboBASIC that'll do about the same as those COL80HND.COM programs I have around, except better, and it won't give me that Error 165 no matter what I do! (I'm running on a stock 1200xl, stock 1050, mydos 4.56/4, and turboBasic 1.5/a???)

Anyone else have this problem, or would be interested in an 80col handler for TurboBASIC (I'll trans.it to Action! when I get it...'ll be much faster)???
Thanks... Bill

(I LOVE and and Or!)

How much Mem does R:Verter take up?
Bill

Also, is there a way to make MyDOS NOT load itself after you Bload a
program?

(i.e.: I made the following file:
255
255
2
211
2
211
52
This POKEs 54018,52..to play a cassette.
The only problem, is MyDOS tries to load itself, 'course it's not
on the same disk!, so I loose the effect and have to run it from DOS2.5!)

That sounds interesting. I was just reading about RLE files and such.
Also in the same (old Antic) mag, I saw an add that had two drawings.
One was a screen that said "Blah Blah Blah Blah Blah Blah...enter choice"
and the other had a picture of people walking around talking, and a
picture of a post office and stuff... pretty neat... Also, somebody did
a program like that for c64's... Looks spiffy! Are these still around?
Bill

You've got it reversed from what I recall reading (about a day ago!) in their catalog. 3.5 drive is #2 if 5.25 drive is #1.

Also, it looks sort of ugly, because it's just sitting there on top. No cover or anything!

How much are XF551's, anyways? Any why that name!?
Bill

Who out there knows the original reason Atari made that drive!? (I do! ;))

536. X10 PowerManager software help needed

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-02 03:10:17 UTC
From: marcotte@unixland.natick.ma.us
Message-ID: <1992Feb2.031017.5772@unixland.natick.ma.us>
Source record: 112655

I am having trouble getting the PowerManager software from
Terrific Corp to work with my X10 home control computer
interface. The software does not seem to be communicating
with the interface (the screen freezes up at the set time
and date display). If anyone has this software and has
gotten it to work, I'd appreciate it if you could send me
some advice at the email address listed below!
Thanks!

Lou Marcotte

542. Reading Atari disks with IBM DOS

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-02 15:21:25 UTC
From: vonwaadn@kuhub.cc.ukans.edu
Message-ID: <1992Feb2.092125.37518@kuhub.cc.ukans.edu>
Source record: 112682

Does a utility exist to allow an IBM or clone PC to read Atari format disks?
I recently sold my Atari 800, and would like to move the data to my IBM.
My disks are single and double density, created with an Indus GT.

E-mail replies are greatly appreciated.

Thanks!
Mark
vonwaadn@kuhub.cc.ukans.edu

Message-ID: <53852@cup.portal.com>
Source record: 112676

Awright, so if you "write a game for the 2600/7800," how the dickens do you move the game from your development system (aka Atari 800) to the 2600/7800? Burn a PROM? You must go through a lot of PROMs during the development phase, I take it... I'm just very curious how much "extra equipment," of what nature, is involved in programming for those systems. Such programming is surely more than pure programming, per se!

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <53854@cup.portal.com>
Source record: 112678

Bill's still around the Bay area. He's a member of BAAUG and has made it to some meetings. For a while he said he'd sold off all his Atari equipment but ended up buying a STE (I think). I wish I could remember the quote, but it was something like, "Out of some sort of misplaced loyalty to Atari" He said his son uses it for doing animation. He's working as a programmer now.

546. Re: Atari 800 (re Re: How's this sound?)

Chris,
You could always use EEPROMS or EPROMS during the development phase.
This would allow you to only buy a few chips for testing... Most Electronic
Mail order companys sell what your looking for!

Bye,
John

548. Creative DLI for precision timing

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-02 21:39:30 UTC
From: deaven@physics.berkeley.edu
Message-ID: <koop8iINN8oj@agate.berkeley.edu>
Source record: 112677

Hello fellow Atari 8-bitters, I have just found this group.

I saw some interest in DLI's in some previous postings, so I thought
I'd mention a favorite of mine. I have an electric slot car set and
I have set up an 800 to time the cars as they race around the track. I
get better than 1/100 second timing by using multiple DLI's to split
up the 1/60 second VBLANK clock. The cars cross an infrared beam at
one point in the track (there are two vertical beams each with an LED
and phototransistor) which is interfaced to the joystick ports.
A simple BASIC program then takes care of posting the lap/cumulative
times for each lane. I have played around with posting scale MPH and
other stats--once the assembly code does the hard work BASIC can
do the rest.

If anyone is interested I'll send 'em code and a description of the
circuit I used via e-mail.

I always like all the COLOR in I+Magic games. Also, LucasFilm made games
like Raiders of the Lost Arc, Empire Strikes Back, Star Wars, Return of
the Jedi (AWESOME GAME!!!), and Return of the Jedi light-saber fight.
My friend's dad used to work as a security guard at LucasFilm, and got
free or reduced price games.

Also, anyone ever see a 2600 game by some company with a 3-d maze and big
faces chasing you around? My friend had it, but I lost contact with him
and don't know his #/address or if he even still has it.
Bill

Re: Apple II's drawing fast.

You know artifacting on the 8-bits!? Well you should just SEE how the
Apple's do it! It SUCKS!!! It is SOOOOOOOO weak! I make simple
programs on the IIs and IIGSs at my school (poor school!) that draw lines
from the center of the screen outward, to make neat effects, but if you
change the color, especially on the IIGSs which have 2 more colors or
something like that, the other pixels next to the new color all change to
white and purple and stuff! It SUCKS!!!
AND! If you draw a diagonal line with color 3 (white), the lines WILL
NOT be connected!! I say use my simple little BASIC program I posted...
Works MUCH nicer! (and you can do patterns if you figure out how... I've
not tried as-of-yet...)
Bill

553. Re: Power Supplies -- Indus/800 XL

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-03 00:16:06 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <J0kJFB8w164w@cyberden.uucp>
Source record: 112647

Let's see. Let me check my little San Jose Computers pamphlet and see what they say about adapters... sheeite! Where'd it go!? Ok.. I THINK so? They list:

XL/XE (xpt 1200XL) $19.95
800-1200XL-400-810-1050 $9.95
2600-5200 $4.95
7800 $4.95
520ST... etc. You can tell that because BOTH the 2600/5200 and 7800 cost the same, but weren't listed on the same line, that they are probably NOT the same. I know that my 1200xl and 1050 look the same (gets confusing, but I don't think I'll worry if I get them switched!)

So, go call SJC @ 408 995-5080 and ask'em.. This pamphlet was as of Sept/Oct 1991, and at least >1< price has changed (for the worse, of course!)

554. Re: Sound from monitor jack

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-03 00:21:43 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <wiLJFB9w164w@cyberden.uucp>
Source record: 112641

As to your Mon->3 RCA problem. Hmm.. Do you have 2 jacks in the back of
the monitor, and is the monitor sound?
I have a mon->2 RCA plugged into the back of a SONY TV via the video
ports (makes changing convinient.. call me lazy!) I KNOW that comp
luma/chroma do come out of even the 5 pin din monitor ports (if there are
8-pins out there... I know for the newer c64's/128's there are..)
The major question is if the monitor has sound capabilities (may just be
a simple case of volume control!), or if it doesn't and has no other RCA
plugs in back, try hooking up the other 2 RCAs to a stereo or tape
player. You can probably get RCA->mic adapters pretty cheaply at a
computer or electronics store (Radio Shmuck just happens to pop into mind
for some unGodly reason!) So, I hope I've helped out at least a little.
If people are still confused with your question and my ideas didn't
work, I'd say try to describe what's going on as EXACTLY as possible.
Bill

ColRVIEW is a nifty program that reads a special type of format file..
RGB files. There is a nifty other program the reads GIF and other file
types and strips them for use on the system. All this stuff is on GENIE.
If you want I could upload it to the archive sometime this week.
Andrew

Well...it's the distributor's determination of whether there's a market or not that gets you in. We talked to our distributor and they said they probably wouldn't take new ST magazines. Other distributors we've spoken to have basically told us there's not enough of an Atari market to justify their carrying any Atari-specific publication.

It's a tough sell, even for ST and Amiga mags. Our distributor even went so far as to say they'd think twice about new Mac publications!

has anybody had a problem with their atari 1027 printer in that the impacter or something isn't hitting properly and the type comes out faint and relatively messed up? has anybody fixed this problem at home?
Has anybody found that their atari xm801 printer became real faint after awhilw and pretty unclear to read? I've put in new ribbons and everything and still had the same problem. I've sent the 500 dollar piece of crap to atari before and 3-4 months later finally got anyother one. Does anyone know what is wrog with the one I have now? I'm not sending it back and am definatly not buying atari if I get up the money to buy something bigger than an 8bit machine.

565. printer pause

Newsgroup: comp.sys.atari.8bit

Source record: 112615

also, why is it that when using atariwriter and the 1027 printer the damn thing would just *stop* for no reason, ttake anywhere from a 2 minute to 20 minute break, and then keep on printing? This was amusing and all to my friends with C64's but kinda pissed me off when I had 20 page papers due the next day...

Hi Shawn!

Yes, Colrview is PD (I'm the author). Alone, it does not read GIFs.
Rather it displays pictures created by APACVIEW (the latest version)
that were created from GIFs. In other words, you need both programs
in otder to read and display GIFs (not enough memory in a stock 800
to do both in one big program.

Nope, it loads as DOS.SYS.
Presumably this is to save memory (?).
It's kind of obnoxious and I think FrOst BASIC is some
kind of prerelease version. As I said in my original post,
I had the disks from Happy-Computer and they had a straight
version of the interpreter for the 800 and I don't recall the
message being "FrOst BASIC"... My other guess is that FrOst BASIC
is meant to load from cassette on a small machine.

>(I LOVE and and Or!)

I did this years ago when I first got TurboBASIC with the V: 80 column
(Gr.8) handler published in Compute!. Kind of tricky since the handler
choked on XLs to start with and conflicted with TurboBASIC, but if it's
legal to post something from Compute!, I'll put it w/ docs on the archive.

What about B&C, Best, etc that still have some stuff? That's a little
different from a K-mart in Nebraska. I see nothing wrong with copying
something that isn't available anywhere. The problem would be to
determine what is fair game, and what shouldn't be copied.

Just my opinions.

Source record: 112620

HOW exactly does ColRVIEW work? You (somebody?) said 4096 colors?
That's nearly impossible. The Atari has only 16 colors and 16 shades. I made a static 256 color display using mode 9 and a multiple-DLI. Looks pretty, but is useless. APAC files use alternating 16 shade/16 color modes, so if you step back it will be 256 colors ANYWHERE, but it STILL looks funny because of the alternating modes. It also halves the resolution from a sucky >80< x 192 to an even suckier 80 x >96<! That beats Apple II's *ss's off, but still can look PRETTY whimpy compared to what it is for. I made a really simple TurboBASIC program that will copy every other line (shade) to the next (erasing color) so you can print them as 16 shade pictures.

fontana@mercury.cis.ohio-state.edu (Mark Fontana) writes:
>
>So why doesn't someone just take the initiative and start a site?

IF someone does this, they had better check the legalities VERY carefully
before continuing. Sorry, a word from "a company spokesman" is not
enough - I'd want there to be a written release from the company
involved, if they're still around, or a release from the attorney
handling the bankruptcy business, if they're not. As an example,
someone said here that Epyx had said they didn't care if their software
was put into the PD or not. Well, a couple of those games are my work,
and that was the first time that *I've* heard that my royalties are
no longer active. I'd be seriously pissed off if, say, Gateway to Apshai
showed up on some ftp site somewhere without people even having the
courtesy to *ask* me about it.

>the general consensus was that
>most of the software companies are out of business, and the ones that
>ARE still around no longer support the 8 bits and could care less.

Support the 8-bits? No. Could care less? NOT guaranteed. Like I
said, I'd like to see that in writing.

>According to one poster, a company spokesperson figured the software was
>already on BBS's anyway.

When I worked for Epyx, we figured that the software was on BBS's within
a week of its release. So?

>Of course, no software currently being PUBLISHED should be permitted on
>such a site. (But a copy of Defender would be fine, even if it is still
>sitting in the discount bin at K-mart in Kuhdorf, Nebraska. The point is,
>it is no longer produced or supported by Atari. If K-mart hasn't sold it
>by now.... that's their problem.)

"No longer produced or supported" does NOT mean "free for anyone to use".
Again - the copyright issues are complex. Don't make any assumptions,
or you might be in a bit of trouble.

>If you're still worried about the remote possibility of a legal issue,
>consider the massive amounts of adult graphics transmitted daily on the
>Internet and stored at FTP sites; transmitted at federal expense and
>available to just about anyone, including minors. Anyone investigating
>a couple of us old 8 bitters swapping old software for a [dead] computer
>ought to focus on the bigger issues. (Don't start a discussion on
>net.pornography, I'm just using it as an example.)

Well, in my world, copyright violations are a lot bigger issue than
sexy GIFs. The argument doesn't hold water, no matter what you think
of sex vs. computer games. There is nothing preventing the Feds from
busting *both* operations.

Mike Farren - no longer employed by Commodore. Still only my opinions,
and not those of any organization.

Yes,
The 800 does have the ability to pull out the OS and (3)16K RAM
cards. In fact When you dissassemble the machine {Wich I've done MANY times}
You'll find that the CPU board also pulls out like the others. This board has
the 6502 and other ROMs...
I wish I had a 32kRAM card and/or the 80 column board for the 800 line!

Enjoy...
John

Message-ID: <1992Feb4.113650.4027@aber.ac.uk>
Source record: 112619

I'm having problems with my XMM801. The print quality has gone crap and fuzzy. It looks like the middle set of pins are striking when they shouldn't. This is making lower case impossible to read, and makes S look like B or 8.

I've had the printer to bits, and got to the pins. It looks like the centre pin has bent, which obviously isn't doing it much good! You don't have to buy an atari replacement. The XMM801s are actually made by SHINWA, and the two printers are identical, except for the case and 1 extra PCB hurridly clipped into the back by Atari. This board hangs upside down off the shinwa board, which is why the molex connectors are upside down on the XMM801. I'm looking out for a cheap 2nd hand shinwa cp80 so that I can get the mech. out of it and clip it into the XMM801. The CP80 is a crappy printer, so you should get one VERY cheap 2nd hand.

Hope this helps.

Well. Count me as one person who HAD trouble with the Expo91 Demo file at first, but has overcome them and is VERY impressed with the demo! (except for the text being mostly in Dutch which I can't read... what do you call a person who only speaks ONE language? American...) For the record, the fix posted here recently "remove the extra 'b' character from the one line of the fourth part of the file that is obviously one character too long" (it does stick out like a sore thumb; it is also the only line of the data portion of the UUencoded file that doesn't start with an 'M'), WORKS. Take out that 'b', UUdecode, unDiskComm to an Enhanced Density diskette, and VOILA! A demo that in my opinion would do justice to the Amiga! (And I should know, I have one...) My next project will be to see what I can do about extracting the individual code segments from the boot disk for disassembly. One message that briefly flicks onto the screen sounded very intriguing: something about "GigaPacker", and how it was slow but... (the rest of the message blipped off the screen too fast to read)... Anyway, this disk certainly COULD be in a data-compressed format, it's got a LOT of code packed onto it -- anybody here know anything whatsoever about this GigaPacker, before I go plunging into the disk to find it for myself? (Which will doubtless be difficult; those European programmers are extremely clever with their coding...!) This whole thing inspires me to write something of my own... or at least finish one of the MANY things I've STARTED... ;-)

Thanks to everyone who helped me out on this problem. The monitor
I have has only one plug, so it has no sound. SO I looked at the other
two plugs on the cable and one thought came to my mind: Stereo output.
Of course that Idea was silly, but it didn't stop me from buying 2 RCA ->
headphones connector (or a couple of connectors I hooked up to get the
same effect. Alas, nothing but static came out. For some reason I thought
I should get something even if only one of the plugs carried sound. I've been
assured by several people that one of the plugs does carry sound and as soon
as I stop by my local electronics supply store (read: Radio Shack) I will have
the appropriate connector and be able to listen to Ms. PacMan chomp away on
my Atari.

Hi Bill! I've already written an 80 column handler in Action! It's pretty quick, will do both 80/23 & an almost illegable 80/27 screen & switch to 40 columns if you need it on the same screen. I should say it's not really a handler since it doesn't install itself in the handler table. It's currently mixed in with an 80 column terminal program I'm doing. It could be changed to 80/24 if you're willing to do a display list. Tell me when you you get your Action! cart & I'll E-mail it to you. It'll really get you jazzed about Action! You don't need to even know how it works, if you use the
include "HAND80.ACT"
at the start of your program then you can just: Print80(Hello World!")
Print40("Big text") etc.

588. FOR SALE!

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-04 18:15:04 UTC
From: Archangel <RHR101@psuvm.psu.edu>
Message-ID: <92035.131504RHR101@psuvm.psu.edu>
Source record: 112618

I have the following items for sale:

1. Atari 800xl with RamBo XL installed
2. Atari 1050 disk drive with Happy
3. Atari's DS/DD disk drive
4. Atari SMM Printer
5. Supra 2400 baud modem
6. ICD's 1 meg MIO

All cable and necessary wires are included. Much software available too.
If you are interested, leave a message here, or give me a call at
814-949-5782. Make me an offer, and I'll see what I can do!

Rufus

589. 800XL Question

Newsgroup: comp.sys.atari.8bit

I have a question. I was working with my "new" 800 XL and it did not
give me an error until I got to 1E-128, and I know my 400/800's did
not flake out until 1E-99. Does the XL series have an improved
Floating Point routine?

>
>Is the disk format for that compatible with anything else? (IBM/Mac?) I
>know that MyDOS can format a 1050 drive's disk to be usable on an IBM..
> thanks
Well I am back after four days of the READNEWS being down on the main-frame here. Mydos cannot format 1050 disk drive disks with the IBM format, rather there is a program for the IBM that will read the Standard 180K (Double Density) formatted Atari disks, which Mydos uses in addition to SmartDOS.
To answer your question about the XF551, it can act like a modified (double density) 1050 disk drive, or also be double sided, i.e. 360K of storage. If you install the 3.5" drive kit from C.S.S., it comes with a program that will allow it to READ IBM/ST floppies.

>advance.

The jack actually has the following outputs:

Chroma, Luma, Composite, and Audio, plus GND. Depending on how your
cable is made, some or all of these will be brought out as RCA conn-
tors. I don't hvae the pinouts of the jack on hand at the moment,
but Audio IS there.

Source record: 112614

Hiya Bill!

The latest versions of APACVIEW and COLRVIEW should be on GEnie,
CompuServe, and various BBSes around the country. I don't know
if they're in the archive here. With APACVIEW you can read GIFs, and
create either APAC mode (80 x 96), interlaced APAC mode (80 x 192)
or COLRVIEW mode (80 x 192 with 4096 colors) picture files. You
need COLRVIEW to load this last file format (it's really 3 files,
each with one color component). APACVIEW/COLRVIEW also support
160 x 192 with 64 colors (made of graphics 15 pixels), which looks
great for line drawings, cartoons, anime art, etc.

I believe both programs made it to the AIM 8-bit disk-of-the-month,
so check with your friendly local club for them. Remember they are
shareware everybody :-)

I'd like to find out what the file structures are for
atari DOS, MyDOS, and SPARTADOS. I have the info on
plain old single density (92K) atari DOS. How is the
1050 density and a half (140K) different for atari DOS?
Does MyDOS use the same format for the VTOC on a 140K disk?
If someone could point me to a source of information,
it would be greatly appreciated.

Thanks.

Would the best route to take be "news stand only" instead of subscription? (doesn't sound like a good deal for the consumer, does it?) It would save on mailing costs and get you a copy with the front and back cover intact! This would at least get people in the store asking if the latest issue is in. Who ever asks when they have a subscription?

Bob...it's usually best to do both newsstand and direct subscription. There are some people who just don't have the time or can't get to a bookstore. As with most things in business, the more ways someone can get your product, the better!

As for the "intact" covers, that can easily almost guaranteed by 1st class subscriptions mailing in a protective envelope or slip cover...this could even be done for 3rd class mail if the money is there to pay for the additional cost.

One thing you should be aware of with newsstand distribution is that the magazine publisher does not get paid for the issues sent right away...inf fact, it is usually anywhere from 3 to 6 months before you receive payment for a given issue. So, anyone wanting to go for newsstand distribution, assuming a distributor will take you, must be able to print at least 3 months worth of issues WITH NO INCOME coming from the distributor. For a magazine the size of AIM, that's a good chunk of money -- close to $20,000 for that 3 month period.

Without a good subscriber base and fairly steady advertisers you can count on, you'd better have DEEP pockets to go with a magazine distributor.

They may be too fast! Sometimes, little glitches that slow chips can not "see" can trash a really fast chip. How do they "not work"? I don't recognize those numbers - are you sure that they are normal 256K DRAMs? There are some special purpose chips out there that may not work. Goldstar? With 256K chips at less than a buck, just chuck them! I have a bunch of spares if you are stuck.

I'm sure that Marver and other 8-bit supporting companies would be very
supportive of an 8-bit only magazine. That's one of the reasons I believe such
a publications would be viable. There are a number of things that would be
needed to make a publication like this work:

1) A handful of advertisers willing to pay a fair rate for direct market
advertising. (The 8-bit market has that)

2) A group of writers/staff willing to work at this for little or no
monitary reward. This includes everyone from authors to publisher.
(The 8-bit market has that, too)

3) A large number of direct subscribers willing to pay a higher than normal
rate for subscriptions (like $25/yr). (Ben Poehland and Jeff McWilliams
are trying to determine if the 8-bit market has this)

Given those three key elements, an 8-bit only publication would be workable.
The quality and size of the publication would be wholly dependent upon the
number of subscribers. To give you a rough idea, to produce a magazine
"exactly" like Atari Interface (not counting any advertising and with a smaller
print run), you would need approx. 2,000 direct subscribers at that $25/yr

rate. Of course, printing a magazine with less pages would lower the cost.

At 500 subscribers, something along the lines of AtariUser would definitely be doable. With 1,000 subscribers, you could do something similar to Atari Interface but at around 1/2 the size (not sure about full color covers, though. It would take a bit of number crunching to find out).

All of this is without any newsstand distribution. You would, actually, need a larger subscriber base to be able to afford to do newsstand distribution (assuming you could get a distributor to accept the publication).

Sb: #16637-8-BIT MAGAZINE
Fm: Atari Interface 70007,4640
To: Bob Woolley 75126,3446

The other message I just left was getting pretty long. Since this is only tangentially related, I thought I'd leave it in a separate message.

I mentioned the three key things needed to be sure this 8-bit only publication would be viable. The 3rd one, the subscriber number, being the most important.

If the results of a survey we did of Atari Interface readers is any indication, there does appear to be enough 8-bit users still out there. Our survey results show that 28.3% of our direct subscribers are 8-bit only owners, 38.8% are ST only and 32.8% have both machines. We currently have approx. 4,000 direct subscribers, so that means that around 1,100 of our subscribers are 8-bit only users and an additional 1,300 have both an 8-bit and an ST.

Our survey polled only direct subscribers, not people who bought the magazine from newsstand shelves or computer stores. So, the numbers can't really be projected to be true of all 10,000 circulation.

Source record: 112556

Goody! I get to answer another question! Well.... GIF stands for (correct me if I'm not exactly quoting it, guys!) Graphics Interchange Format. I'm not sure how it's formated, but it IS compressed. There are at least 2 GIF viewers for the 8-bits. I don't think either care if you have 256k or 16k..(well..256 or 32...)
The programs are AT8GIF.COM, which stands for Atari8-bit GIF viewer and APACVIEW.COM (I have APACVW12.COM as well.. my ARC of the original APACVIEW release is really thrashed for some reason...) I'm pretty sure both require a file with RGB data. AT8GIF.COM is good as far as resolution, but that's it. It can go up to hi-res (320x192x2 - 320 pixels/line, 192 lines/screen, 2 colors) if needed (I have a Mac picture somewhere). It's other mode is 160x192x4. The only problem is how it shows the colors. It shows them as red, green, and blue (and black). When mixed, these colors can look good, but most pictures I have SUCK with this viewer. It sets up 2x2 pixels to show the colors. Purple would be red,blue/blue,red .. actually, more like red,blue/black,red or something. I don't really recommend this program, but it's good to have just in case.

The other program, APACView was made after the programmer (forgot his name) read about APAC screens in Antic or Analog magazine. APAC stands for Any Point, Any Color. Since you have the 800xl (well..more like NOT a 400/old 800), you have the GTIA chip (George's Television Interface Adapter?). It's capable of taking 8k of memory and displaying it as 80x192x16. Now, this looks REALLY good. If, say, you have a digitized ComputerEyes picture in 16color mode, you can switch APACview into b/w mode and view it fine. (it has 2 loads.. GIF (*.GIF) and APAC (*.PI9)). The 3 GTIA modes are: 16 shades of a background color (I made TRUE 256 colors by changing the backgd down the screen 16 times! using a DLI)...9 colors that can be changed... and 16 colors of a certain brightness (except black, black stays darkest.) (Note that ONLY mode 9 - 16shades - can view 16 shades, using POKE or SETCOLOR will only give you 8 shades! :( )

What APACView does is alternate the modes on the screen (using a DLI, I'll suppose...what else!?). This gives you 256 simulated colors anywhere on the screen by coloring on the color line, and brightening it on the shade line, so if you step back it will look ok. The only problem is because the mode lines are alternated for this program, it gives the GIF file 1/2 as many lines down the screen to use (not too much of a problem because AT8GIF did pretty much the same thing). It ALSO is only in 80 columns, giving you a HORRIBLE resolution of 80x96 vs.160x192, but who cares, because as I said, AT8GIF works about the same as far as ridding you of resolution!

What >I<'d like to see is a really fast page flipper to double the
vertical resolution. There would be a full screen of color, and a full
screen of shades, then flip between them and simultaneously change
between the two modes (color & bw). I've tried.. 'course that was wiht
BASIC, (turboBASIC, mind you, but still)... Maybe when I get Action!???

Also, a neat thing to do is double the horizontal res. by, again, having
2 screens (doing both uses 4 screens..32k, it would JUST fit on a 48k
machine with a reasonably small dos, say MyDOS or AtariDOS
must continue later!!!

As I was saying before I had to disconnect..

Both will show approximately the same resolution of GIF pixels, but in
with different set ups. 4 colors to make 256 will work by patching 4
next to each other, but it looks terrible in many cases to 16 colors AND
16 shades using the same space to make 256 colors. Both have the ablitiy
to zoom and move around and stuff, but AT8GIF handles it more nicely.
You can view .PI9 and .GR9 files with APACView, but other than the
annoying zoom control and a few other things I think could be added (that
are in neither anyways), I think APACView is the best.. You SHOULD,
however get AT8GIF because of it's 320 feature and stuff. I usually use
APACView 1st, and then AT8GIF to see if theres much of a difference.
Hope I helped!
Bill Kendrick

Cool! I was hoping there was or would soon be a multiple screen GIF
viewer to enhance color quality. I'm wondering, are their any paint
programs out their that support any of these formats? Also, Interlaced
APAC? I have APACView 1.2 I think, and ILBMRead and whatever else can
out in the APACVIEW.ARC, BUT!!!! only the RGB file would BARELY make it
out of the arc, and the instructions, and I think that was about it.?

BTW: What's the diff. between ShareWare and PD? Can a place selling PD
sell ShareWare for the same price, or at all? (the PD I've seen is
between $2-4 depending on where..)
Thanks! Bill

Difficulty of installing the Transkey IBM keyboard adaptor depends on whether your POKEY is socketed or not, and whether you want to mount the keyboard JACK in the case or not. If you have a socketed Pokey, or want to socket it yourself, then a small daughter-board plugs into the POKEY's socket, with the POKEY plugging into the daughter board. A small ribbon cable runs from the daughter board to the main Transkey board.

Four wires run from the Transkey main board to the GTIA, where they are soldered to pins on there. Then there is a connector on the Transkey board. On this connector on my model is a small ribbon cable with an inline DIN-5 jack on it. That is where the keyboard plugs in. Optionally, you can get a case-mounted jack and drill a hole in your XL/XE case and mount it in there.

The 1027 printer is a piece of junk. I have 2 dead ones here and Im mulling
over fixing them or not. They gave me nothing but problems and broke due to
no fault of mine. I damaged the motor on one and the printer heads on
another. Try to replace the ribbons on the one you have to fix the problem
of faint type. It impacts quite hard onto the paper.. I dont think thats
your problem (the heads).

I dont know anything about the XE line of printers.

Perhaps youd be better off with a panasonic or epson printer?
Just get an interface (if you dont already have one) and the cord
from a supplier and you can use a NON atari printer.
You also might want to look into the 825 printer at best for $59...
No NLQ mode though.
If you like 40 columns, the 1020 is kinda nice.. does colors too!
Kinda funky little bugger.

How is it that you can load in atariwriter and do 20 pages on it?
I load in about 9 before its buffer fills up and I have to "Link" files with
other things.

What you saw I think was an ad for "Games Computers Play". This was a service similar to GEnie or COMPUSERVE, except everything was done graphically. Want to read email? Then you would use your joystick to move your man to the post-office on the screen. There were online graphics games, like what GEnie and COMPUSERVE are starting to offer if your machine can run the front-end programs.

In my opinion, Games Computers Play was ahead of its time. Too bad it didn't catch on then.

The reason it "looks ugly" is because you have to purchase your own
external drive case. C.S.S. wouldn't make any money selling cases for
all their floppy/hard drive products.

Whenever I meet somebody who has written an out-of-print computer
program I ask him if he would consider making it PD. Would you consider
releasing your Atari 8 bit programs to the public domain? Would you
consider releasing your source code to the public domain? At this time
I'd guess that you are not going to receive any more royalties on Atari
8 bit programs. But there are still some people who would like to have
them. Perhaps the continued use of your work would bring some fame and
help you make money in the future. If your source code could be studied
it might help new programmers to learn how games are written.
I certainly agree that the copyright issue is very unclear and
complicated.

609. Digi-Studio

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-05 14:14:12 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Feb5.141412.10158@aber.ac.uk>
Source record: 112648

Here is a copy of the official information sheet for Digi-Studio. An order form is included at the end. I still have no US distributor for Digi-Studio, so copies are still going to have to be ordered directly from me in the UK. Monies should be paid in pounds sterling by International Money Order.

Copies of my on-disk Atari 8-bit newsletter have been posted to the atari archive, and should be available there soon.

Digi-Studio Information

Digi-Studio is a new piece of software for the Atari XL/XE series.

It allows you to play music using real sounds which have been digitized.

Digi-Studio comes with a keyboard player and tune player. The keyboard player lets you use your computer keyboard like a piano keyboard to play tunes, but using real sounds, rather than computer-generated noises as is usually the case with this type of program. You can have 3 sounds in memory and can quickly change between them while playing tunes.The keyboard player has responsive keys so that the sound will only play for as long as you hold the key down.Just like a synthesizer!! The Digi-Studio disk contains many sounds for use with the keyboard player, ranging from church bells, to pig grunts, to a baby crying, to screams, and lots of synthesizer sounds. In fact around 25 sounds in all. Why buy a synthesizer when your Atari can do the same?!

The tune player allows you to play pre-programmed tunes using any of the available sounds on the disk. Five tunes have been included on the disk for you to play.

Digi-Studio comes on a DS/SD disk, and includes a printed manual. It is aimed at everyone, whether musically inclined or not! You may just want to use it for fun, or compose a tune with it! The comprehensive user manual makes it a joy to use!

Digi-Studio will only work on XL/XE computers with 64K RAM. No extra hardware is required. The sound samples just play through your TV speaker!

The full Digi-Studio package costs just 5pounds in the UK, and 10pounds for foreign orders, including printed manual, and shipping. All payments must be made in UK funds (pounds sterling) and paid by money order in sterling if you are ordering from a foreign country. Order your copy today!

--------CUT--------

Please send me the Digi-Studio package. I enclose a cheque/PO for 5pounds (10 pounds foreign payable in sterling) payable to: DEAN GARRAGHTY.

What type of set up are you using for your modem? If it's an 850, PR:, or
you have a compatable it'll run. Straight Basic is a little slow, but if
you can get your handler under TB you could fool around with it. IMHO: We
(people who have hung onto our 8-bits) are getting few and far between.
Software still gets spread around, but I recall Wright's Station BBS shutting
down because calls had gone from 40 or 50/day to 1 or 2, ditto for WCS.
It would be kinda like giving a great party but having no one show up.

Correct me if I'm wrong, but what good is a program that displays
4096 colors when GIF's are only 256 colors at the most?

BTW, even though it is a cool program, I have yet to see an APAC color
GIF that came out looking the way it should. Playing with the TV's
brightness and color doesn't seem to help.

Well, they aren't *mine*, they're Epyx's. So the question is moot.
If it were my decision, though, the answer would be "maybe" to the
games, and "absolutely not" to the source.

>At this time >I'd guess that you are not going to receive any more royalties
>on Atari 8 bit programs.

Actually, I haven't gotten any royalties off them for years, anyway. But
that's kind of beside the point. It's a tricky question as to just what,
exactly, I'd be giving away with the games. There's a real good chance
that if I released a game into the public domain, any and all versions
of that game would *also* be released into the public domain, and that
might be a very bad idea. Look at EA, who are now making even more money
off of the Nintendo version of M.U.L.E.

> But there are still some people who would like to have
>them. Perhaps the continued use of your work would bring some fame and
>help you make money in the future. If your source code could be studied
>it might help new programmers to learn how games are written.

Perhaps - on the other hand, the best way to learn how games are written
is to write one. Seriously! My source is full of "mikefarrenisms", which
might (or might not) have any utility for anyone else. Make no mistake -
I'm rather proud of some of those games, and at least one of them is a
damned fine piece of work, if I do say so myself. But still, I'd be
very reluctant to release the source code.

617. Digi-Studio

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-06 12:30:06 UTC

One important thing I didn't mention on my last Digi-Studio posting, was where to send your orders!! Please send your orders direct to me:

DEAN GARRAGHTY
23 YSTWYTH CLOSE
PENPARCAU
ABERYSTWYTH
SY23 3RU
WALES,UK.

I was hoping that my good friend in the States, Jeff Edwards, would distribute D-S in the States (he's always distributed everything else I've written), but backed ou because he feared he wouldn't sell any. I'm sure that if there was sufficient demand for it he would agree to sell it over there. I would even consider giving him duplication rights so that we could get the price down. If you would like to see D-S available cheaply in the States, then please write to Jeff at the address below. He also has a good PD library, with lots of my software in there, and sells my on-disk newsletter, News-Disk, over there as well. He really does need your support, so drop him a line at:

JEFF EDWARDS
138 SOUTH MAIN STREET
TRAVELERS REST
SC 29690

Please mention that DEAN GARRAGHTY recommended him.

Thanks,
Dean Garraghty. djg0@uk.ac.aber

Turbo allows bit wise operators right? If it does, with a graphics 24 screen you just convert the character to the internal code i.e. 0-31 add 64 etc. This number X8 gives you the offset into the character set. You need a redefined chacaracter set that is only 4 pixels wide. If the X position of the character to be printed is even then you multiply each byte by 4 to move the bits two to the left, if it's even you divide by 4 to move the bits right (all this is on a 0 to 79 position screen) The 1st characters is copied directly to the screen something like:

```
FOR Z=MSC+INT(XPOS/2)+YPOS*320 STEP 40
POKE(Z, PEEK(CHARBYT)*4)
NEXT Z ;Whoops ' add 'TO MSC+INT(XPOS/2)+YPOS*320+280
```

I don't know what the bit wise 'OR operator is for TB, but for the odd field you just POKE the OR value of the existing byte with the value of the odd characters value.

Boy! noticed another mistake the 2nd even was supposed to be 'odd, I'm going to have to stop replying on line <g>.

Was a fix to this published? It does that with my P:R: connection
also. Didn't happen (at least I don't think) when I had an MIO
a few years back. It is really annoying. When doing text it may
happen every couple pages, but if you want to do say a printing from
Daisy Dot III, which sends reams of bit-image data to the Printer,
the pauses can be a real pain as they happen often, almost as a function
of how much data was being sent.

I'm glad you got the demo to work. The GigaPacker messages says "it's slow,
but it works!". I don't know what it is either, though. I'm sure a lot of
this demo is coded and packed and protected and all that. I still wish
someone who can get in touch with these people was on the net. Seems like'd
we'd all have a little something to learn!

Well, for an even MORE impressive demo, see the DAS OMEN demo from Germany.
I uploaded it to the archive (gee-I'll be everyone's glad I didn't post this
one...). This one is definitely an eye (and ear) opener.

The program, as I know recall, was called Video-80 and was published
a long time ago in Compute!. It's a device handler (V:) that can
be used on its own (you can copy text files to it, for instance, or
use BASIC I/O commands with it) or can, with a short utility, be hooked
in as a replacement for the standart E: editor, though it only allows
line editing. Is COL80HND PD or shareware? I'd like to take a look
at it.

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <FH3qFB2w164w@cyberden.uucp>
Source record: 112590

I just downloaded a peice of mail (the expo91 demo), and I ran out of room right at the end, so BobTerm (1.21) decided to delete the file for me (argh!... I'll just use DISKFIX.COM off of my 2.5 master disk). I noticed that the seconds went really slowly. It took quite a while to delete the file, being a big 126k!, and the clock fell behind alot. I recall someone at one time mentioning that they "need" an RT8 cart. because the internal clock stops during I/O. As I probably mentioned before, that is INcorrect. Right after BobTerm deleted the file, the clock started spinning VERY fast and caught up 2 minutes in about 5 seconds.

BUT.... I want to know if there is any way to set the Rt clock on BobTerm. I'll suppose that it can load the XIO Rt8 cart handler and such, but I really wouldn't mind a peice of software that will let me set the Rt8 clock, even though I don't have that cartridge. Is there such a peice of software? And would it work only with BobTerm, or say GOE if I ... GOE if it were to have an Rt8 handler...??? Thanks..
Perhaps one of you "brains" out there can make a small [L]oadable file, or MODULE for BobTerm to do this..? Thanks. Bill

Cute! Now that there are much bigger/better computers out there for typical PC stuff like word processing, using an 8bit for control/sensing applications is perfect. In my opinion, anyways. My current project is turning an old unused 400 into a learning IR remote control. Once I've got generic code, I can write a .CMD file for a friend's Pro board... then I'll be able to call up the BBS and tell it to tape a show for me. :)

As for precision timing... have you looked at using the Pokey timer IRQ's for that? You can get much higher resolution (faster than you can service if you like) and it's actually easier to implement. Only one vector to grab.

>change the color, especially on the IIGSs which have 2 more colors or
>something like that, the other pixels next to the new color all change to
>white and purple and stuff!

It's funny that you CONTRAST this with the Atari's "artifacting," because
that's exactly what you're seeing on the Apple: artifacting of exactly the
same kind. The thing about it, though, is that on the Apple they decided
to USE artifacting so that when you specify a "different color," what you're
REALLY saying is "illuminate pixels ONLY in the EVEN columns," or "only in the
ODD columns," whichever happens to yield the chosen color when artifacting
is considered! The specific color you wind up with is a matter of how the
video circuitry just happens to interpret the artifacting... (You can do
the same thing on the Atari by going into GRAPHICS 8, then doing a POKE 87,7
(I think); you can then use COLOR 1, COLOR 2, COLOR 3 and do different
"colors" through artifacting...)

>AND! If you draw a diagonal line with color 3 (white), the lines WILL
>NOT be connected!! I say use my simple little BASIC program I posted...
>Works MUCH nicer! (and you can do patterns if you figure out how... I've
>not tried as-of-yet...)

Color 3, white, from the Apple OS' point of view, require that any points be
plotted as TWO ADJACENT pixels, one in an ODD column and one in an EVEN column
-- and might even further require that the plotted pixels be "ODD then EVEN,"
as opposed to "EVEN then ODD" (i.e. you could plot pixels in col's 11 and 12,
but maybe NOT in cols 12 and 13). A diagonal line ideally "wants" pixels
plotted wherever the line happens to fall, but on the Apple, if such pixels
happen to defy the requirements for plotting in "color 3," the points DON'T
get plotted, hence the discontinuities in the lines you see.

Back in 1982 when I was first looking into the purchase of a computer (the
three choices were Apple II, Atari 800, or Commodore 64), I heard about this
color-and-column restriction of the Apple and eliminated it as a choice...

Ai! You're halfway to implementing a missing component in Frank Seipel's
wish project, that of being able to backup the Atari onto a video cassette.
Namely, one obstacle was that the Atari would like to be able to start/stop/
rewind the VCR under computer control, so as to avoid wasting tape while the
Atari (relatively slowly) brought another chunk of data in from a disk...

I told Frank through E-mail that "what we need is a computer-driven VCR
remote," maybe something like VCR PLUS if you've heard of that (if not,
you soon will, mark my words)... And it sounds, Tom, like you're working
in the direction we need...

You know, I've been reading for YEARS about the "infamous disk-drive pause bug" on the Atari, but have NEVER SEEN it. Sure, my drives will occasionally go to sleep in the middle of I/O, but my instinctive reaction -- hitting the BREAK key a few times -- ALWAYS starts it right up again. I can't BELIEVE I'm the ONLY person who's ever thought to hit BREAK when the drive goes to sleep...

After monitoring Net response to the offer from John Jainschigg of Atari Explorer Magazine to carry Atari Classics as a section of AE, it was clear the majority opinion was against it.

Just to maintain perspective here, I'd like to remind everyone the offer was made to me, personally. It was ultimately my preogative to accept/reject it, regardless of anyone elses' opinion. I had in fact formed my opinion of the offer within the first 12 hours of receiving it. However, it would have been foolhardy of me to make such a momentous decision- with far-reaching effects on the whole community- so capriciously. I shared the news with you for basically 2 reasons: I wanted to compare Net opinion to my own; & I wanted to see if any tangents/angles I hadn't thought of would emerge in the public forum.

Regarding those 2 elements, I report as follows: First, majority opinion expres-sed here on the Net confirmed my personal opinion, which was negative from the beginning. Second, such issues as people raised, tangential & otherwise, did nothing to give me cause to reverse my negative opinion.

Whereupon, on Feb. 4-5, I officially informed John Jainschigg that while I was grateful for his consideration, I respectfully must decline his offer at this time.

The wording of the offer raised a few emotional issues which I chose to brush aside. It was basically a business proposal, in my response to John I chose to evaluate it that way, & Ithink most of the response I saw here on the Net saw it that way also.

There were 3 sound business reasons for rejecting Explorer, as follows:

1.) He offered us 8 pages, 6 times a year. Even assuming Explorer really did publish 6 times a year (a BIG assumption), we would have only 48 pages. This is paltry. In 1991 alone, with far less resources at my disposal, I published ca. 90 pages in Current Notes, & could have done more. A paltry 48 pages/year isn't worth doing; Current Notes is a far better option.

2.) There was the problem of once again having to compete for page space with Atari's other products. This is the same problem we now face with both AIM & CN. Since AIM & CN, respectively, already command most of the market, & most 8bitters already resent having to page thru that other stuff to find the items they want, Explorer offered no advantage in that regard. It would just be more of the same; more of the same is not what we want.

3.) One item no one mentioned, is that the community is now so small it no longer has the resources to adequately support even the 2 major magazines we now have: AIM & CN. (It is my opinion that this dichotomy of pub-

lications is actually contributing to the fractionation & decline of the community.) The entry of Explorer into the market in a major way would accelerate the process of disintegration, & ultimately be harmful to the community. A major objective of Jeff McWilliams' mail survey campaign is to CONCENTRATE our remaining resources into one single common forum, & thus hopefully to restore our splintered market to critical mass.

There were some personal issues, of a minor nature, which I also had to consider. As a scientist I am a rebellious fellow, distrustful of authority. The more autocratic the authority is, the more rebellious & distrustful I become. Any of you folks ever looked at the masthead of Explorer? It's top-heavy with guys whose last name is Tramiel. Now look up the definition of "autocrat" in your dictionary; you'll find there a picture of Massuh Jack. Sooner rather than later, I would come to grief working in such an environment. I need to feel that whomever I work with are people whose motives I can trust, whose efforts are sincere, & whose style of communication is on par with my own. I just did not get any of those vibes from John.

Hmm, after playing around with atari.archive.umich.edu, I have the following report to make, which I am posting here for lack of any better idea:

apac22.arc is corrupted. I fetched it twice, and got the same problem both times, that being a corruption in the .DOC file. I tried it with both the SDX and BoB Puff's arc programs.

expo91de.dcm is also corrupted, somewhere around sector 281. I think someone else mentioned this too.

I'll give my first-born child to anyone who sends working copies of apac22.arc and also ColorView to the archive...

Cross-posted to: ont.micro,kw.micro,comp.sys.atari.8bit,uw.sys.atari,comp.sys.atari.st

In February, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
the 16-bit library. We will also show Migraph OCR (Optical Character
Recognition) and Fun School 4 (educational software from the UK).

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the February issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, Feb 12, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for details.

Hope to see you there,
Dani Roloson

Dear NETters,
Does anyone know the going sale price (if any) for the
Atari 1010 Program Recorder? Also, my Atari 1027 printer died a few
years ago... it printed a line or two, but then printed garbage the
rest of the page. The manual said to 'reset' the print head by turning
it off and on again... but this was only if it printed garbage from the
start of the operation. Did this happen to anyone else, or does anyone
know what went wrong with it?
Thanks in advance...

-Sincerely,
Tony

Source record: 112583

Hello again, Bill.

Yes, APAC works based on the alternating lines of graphics 11 (16 colors) and graphics 9 (16 intensities). This looks pretty good on a lot of monitors, and somewhat drab on others. I did implement a page-flipping version of this (called interlaced APAC, .ILC) that restores the resolution to 80 x 192 in my latest APACVIEW program. The output file is twice as big, as you might have guessed. If you want to print GIFs as 16-shade pictures, APACVIEW can be made to produce pure graphics 9 images.

COLRVIEW produces 4096 colors by yet another trick. I produce three graphics 9 images, one each for red, green, and blue, from the GIF source. At first I tried just cycling these using page-flipping methods. The result was *really bad flickering*, so I devised another method. I would show three screens that look like the following diagram:

```
****Red line 0*** **Green line 0*** ***Blue line 0***
**Green line 1*** ***Blue line 1*** ****Red line 1***
***Blue line 2*** ****Red line 2*** **Green line 2***
****Red line 3*** **Green line 3*** ***Blue line 3***
**Green line 4*** ***Blue line 4*** ****Red line 4***
***Blue line 5*** ****Red line 5*** **Green line 5***
****Red line 6*** **Green line 6*** ***Blue line 6***
**Green line 7*** ***Blue line 7*** ****Red line 7***
***Blue line 8*** ****Red line 8*** **Green line 8***
: : :
**Green line 191* ***Blue line 191* ****Red line 191*
```

...where the three screens shown above left to right are "flipped" on sequentially in time over 3/60ths of a second. If you can follow my explanation, you'll understand it requires a DLI per line, plus a VBI routine that selects one of three starting points/DLIs. So now the flicker present in the ordinary three-screen method is reduced to a "scrolling" vertical effect, which is most prominent in solid red, green, or blue areas. Oh yes, the 4096 colors comes from using three graphics 9 screens, 16 colors each, or 16 x 16 x 16 = 4096. This relies on the fact that your brain has the "persistence of vision" phenomenon. Since the three files are 80 x 192, the full resolution is 80 x 192. This looks great on digitized photographs.

I have also implemented this with graphics 15, for 160 x 192 resolution with 4 x 4 x 4 = 64 colors. This looks great on certain pictures, namely comic art.

I was just informed earlier this week that Current Notes Magazine has a new 8bit Editor, an event which seems to have occurred about 3 weeks ago.

He is Rick Reaser, 8bit VP of the P3ACE group in Colorado. Rick produced the excellent review of the new ChromaCAD program that appeared in the December 1991 issue of Current Notes.

Rick will be running a column called "8-Bit Tidbits". I'll be assisting Rick in the startup phase of his new job- turning over unpublished manuscripts, advising about articles, & giving him copies of software to arrange reviews. In these times of uncertainty in the 8bit community, Rick will continue the tradition of excellent coverage that has characterized Current Notes in the past. Hopefully material that was delayed as a result of my departure will soon go into the pipeline & might appear as early as the April issue.

Rick has already announced strong support for the concept of an independent 8bit magazine & for the mail survey campaign now in progress. Let's all wish him well in his endeavors, & I myself look forward to working with Rick during the transition period of the next few weeks.

> another printer.. the 1027 sounds like a peice of crap!

The 1027 is a piece of crap.. However it doesnt die and need to cool.
I did many pages on it continuously and it worked fine.
Just "thick paper" does it in... Also the plastic print heads die too.
Too expensive to bother fixing.

644. 1027 printer information wanted

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-08 01:01:58 UTC
From: wr@bara.oche.de
Message-ID: <I7W1Sk9ehqs@bara.oche.de>
Source record: 112506

Hello,

I recently bought a cheap 1027, but it came without documentation,
power supply or ribbon cart...
Could anybody tell me what power supply and ribbon cartridge the
1027 requires?
Any ideas how to connect it to the ST?

Hope to hear of you...

645. Re: What's up with Atari corp?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-08 05:55:25 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1992Feb8.055525.26728@usenet.ins.cwru.edu>
Source record: 112588

In a previous article, tony@chopin.udel.edu (Anthony Beard) says:

>What's up with Atari Inc? In fact, what's up with the production of cpus like
>the 130xe, 65xe etc? Are they still being produced?
>
>I've been in college for the past 2 1/2 yrs, so I've been out of the 8-bit scene
>for awhile. I have an 800xl back at home, but I hardly use it except to play games.
>
>I'm also wondering what's up with Antic, Is it still being published?

First off, Atari, Inc. became Atari Corp. in 1984.

Atari officially has nothing to do with the 8-bit line as of 1-Jan-92.
i.e. no production, no support, nada.

Antic as a stand along magazine published its last issue in 1990. It then
moved inside STart for awhile, but then STart ceased publication in 1991.

The magazines that support the 8-bit are:
Atari Explorer, Atari Interface, AtariUser, Current Notes, New Atari User
(Page 6), and 8:16, the latter two being from Britain.

See this group's FAQ for addresses. (look for the revised FAQ to be
posted tomorrow!)

In article <54127@cup.portal.com> Chris_F_Chiesa@cup.portal.com writes:
>You know, I've been reading for YEARS about the "infamous disk-drive
>pause bug" on the Atari, but have NEVER SEEN it. Sure, my drives will
>occasionally go to sleep in the middle of I/O, but my instinctive reaction

...

I have never encountered this bug, period. I have read about it everywhere,
but I have never had my disk drive fall asleep, or the cassette, or the printer.
(But I never had an atari printer. :-) But my mom used to have a 1027 before
she traded it in for the XE/style one that was letter quality (don't know the
model) and she never complained that the 1027 fell asleep either. Maybe
I'm lucky, maybe I happened to get late enough OS revisions that fixed these,
I don't know.

647. hardware questions

Source record: 112592

I was thinking of writing a game that would interface multiple Atari computers
through the joystick ports, using port 1 for input and port 2 for output.
I know that PIA can support this, but I don't know if two machines can be
connected this way safely. Should only the data pins be connected? Or the
data pins and the ground? Any help would be appreciated.

Eric,

Is response to your question about connecting two computers together
and playing a game, say one on one with it, several people have already done
this. I have a TANK game somewhere that my friend Mike and I played
on two 8 bit computers, you go out and rack up points blowing each-other's
turrets to pieces.
Dataque has also produced specs for 'Gamelink', his gaming cable that also
comes with some sort of software protocol. They were working on GEnie on
some sort of game for it, but as far as I know nothing has come out of it
just yet.

Message-ID: <1992Feb8.184815.28174@ra.msstate.edu>
Source record: 112593

Interesting idea... If you were going to connect the two computers or more, I would suggest connecting all the pins _
EXCEPT the +5 volt line. This way you could also use the TRIG lines for interrupts. You MUST connect the ground lines inorder to get vaild information on your data lines. Don't connect the +5v lines or you'll have problems definatly when you have one or more of the computers off.
Later,
John

I've had a 600XL and an 800XL since they came out and I've only seen the bug with the 1027 printer - never the 1050 drive or the XF551. I do remember reading, though, that the problem existed and I thought there was a fix. It was definitely in Compute!'s Insight:Atari.

Message-ID: <aoDuFB3w164w@cyberden.uucp>
Source record: 112508

Hey.. that's right, I think I have the pinouts of the 5-pin monitor jack
somewhere.. Let me check... duh... right there in front of my face!
Ok:

```
_
3 1

5 4
2

_ - notch
1 - composite luma
2 - ground
3 - audio out
4 - composite video
5 - composite chroma
```

I have a simple "commodore monitor jack" that I got from MCM Electronics,
and that you can probably get at BEST, B&C, San Jose, etc. (but NOT at
Radio Shmuck!? at least not the one that (was) around here..?) It
changes the 5pin din to 2rca's: audio out and composite video. I guess
if you get a 3-pin, you can do audio out, comp.luma and comp.chroma. I've
never tried as I've only hooked up my computer to a TV via switch box,
and via VIDEO button (the monitor port.) Does this help?
Bill

```

656. FAQ: comp.sys.atari.8bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-08 20:17:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GGA2E9NIRK8WVYYN@carleton.edu>
Source record: 112524

```
Frequently-Asked Questions
("FAQ")
comp.sys.atari.8bit
Revised 5-Feb-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is this Usenet newsgroup, dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit,
collected and e-mailed to subscribers on the Internet who do not have access to
Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not
implemented at this time. Thus, one should NOT post to
Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear
on comp.sys.atari.8bit.

What is the atari.archive?
atari.archive.umich.edu is the anonymous FTP site which contains many
files for the 8-bit Atari computers. Those with full Internet access can FTP
to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in
your e-mail address as your password. Now type "cd atari/8bit" to reach the
8-bit directories; there are four subdirectories within the 8-bit directory:
cc65, new, sio2pc, and zmag.
Users may upload new files to the atari/8bit/new directory. If it's not
obvious, please also upload a text file describing your upload.
When downloading or uploading to/from atari.archive, be sure to have
file-type set to BINARY when transferring binary files (.arc, .com,).

What is BART?
Some persons have Internet e-mail access but do not have FTP access.
They, too, can access the atari.archive library through the BART mailer.
BART's address is atari@atari.archive.umich.edu. BART automatically UUEncodes
binary files before e-mailing them to you. For complete instructions on using
BART, send a message to BART that says nothing but this:

help
```

Even if you do not have FTP access, you can still upload new files to the atari.archive. Send new uploads (UUEncoded, if binary) to John Dunning at jrd@stony-brook.scrc.symbolics.com.
While in the past UUEncoded binaries have been posted directly on comp.sys.atari.8bit, the practice is discouraged because Info-Atari8 Digest subscribers find it frustrating to have to scroll through long UUEncoded messages to find the postings they can actually read. Please e-mail UUEncoded binaries to John Dunning instead; he'll upload them to the atari.archive where everyone can get at them.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the original Atari online magazine, with over 200 issues published so far. It covers the 8-bit Atari computers exclusively.
Z*Mag is NOT the same thing as Z*Net, though they are published by some of the same people.
Most issues of Z*Magazine since #157 are available in the /atari/8bit/zmag directory at the atari.archive.
Greg Lindahl, gl8f@fermi.clas.virginia.edu, has created a mail-list for distributing Z*Magazine to subscribers over the Internet. However, his mail-list is not in operation at this time because no one has offered to supply him with the new issues as they are released. Contact Greg if you can help.
To contribute to Z*Magazine, send your articles to Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board system. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can telnet (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG members-list are automatically members of the official Atari users' group CAIN - Central Atari Information Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

Are there any magazines still supporting the 8-bit Atari?
There are several:

Atari Explorer Atari Interface
29-05 Broadway 3487 Braeburn Circle
Astoria, NY 11106 Ann Arbor, MI 48108

AtariUser Current Notes
Quill Publishing Co. Current Notes Subscriptions

Page 6 248 Wimborne Rd.

P.O. Box 54 Oakdale, Poole, Dorset BH15 3EF
Stafford, ST16 1DR England
England
&15.00/6 issues surface;
&21.00/6 issues air

Are there any product developers or vendors still supporting the 8-bit Atari?
Ben Poehland has created quite a long list of firms devoted to the 8-bit Atari market. This file is called vendlist.arc in the /atari/8bit directory of the atari.archive.
Ray Wilmott maintains a similar list. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
Yes! There are three files at atari.archive that claim to do this. They are: atario21.arc, pcxfer.arc, and util.arc. Each of these programs runs on an MS-DOS type of computer. For disks written on your PC to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0S/2.5 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is not being manufactured at this time. MYDOS, on the other hand, is a shareware product that continues to be improved upon.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari? It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

> Namely, one obstacle was that the Atari would like to be able to start/stop/
> rewind the VCR under computer control, so as to avoid wasting tape while the
> Atari (relatively slowly) brought another chunk of data in from a disk...

Sure, it's really not a difficult thing to operate the VCR controls. Reading video is much more involved. But I'm confused... how does Frank expect to be able to repeatedly seek to the same spot on the tape? By encoding position info in the video? By using an on-screen tape counter?

> I told Frank through E-mail that "what we need is a computer-driven VCR
> remote," maybe something like VCR PLUS if you've heard of that (if not,
> you soon will, mark my words)... And it sounds, Tom, like you're working
> in the direction we need...

When it's done, I'll gladly post the code (probably Synasm, but I'll make it a text file). I'll add a VCR plus decoder if some kind soul could forward me the algorithm. I've followed the thread on sci.crypt and sci.electronics with interest, but so far it seems the threat of litigation has stopped anyone from posting it. :(

You folks may want to look into what Dataque software is doing - Maze of Agdagon is a multiplayer game reminicent of Midi-Maze on the Atari ST. Multiple 8bit computers can play together through as special cable that runs from one CARTRIDGE port to the next. The game only loaded on ONE of the Ataris, at which point it gets downloaded to the other players through the cable. I don't know what the status is on this game, but if Jeff Potter is still around, I think he could give us all some details.

I just posted the AWESOME Demo from Germnay on the archive in the new subdirectory.

It is in DCM format, i.e. use Bob Puff's Disk Communicator to uncompress. This program is on the archive also, if you don't already have it.

I tested this DCM file to make sure it went back to a properly working disk.

I hope everybody likes it!!!!

Those of you having problems with the Expo 91 Demo: it seems that there are two copies of this in the archive - one in the NEW directory, while the other one is not. There is a large difference in file size between the two, but I'm not sure which one works.

Also, I uploaded the DAS OMEN demo to the archive a few days ago. It doesn't seem to be available, but when it is DOWNLOAD IT!

Wanna know why? It's because the color generation on Ataris is a little screwy, which makes it hard to do good color replication. The colors besides white don't go all the way down to black, and they become whiter as they get brighter. (This sounds like a bleach ad!) So you've either gotta live with screwy colors or use fewer of them.

1) Thanks for posting your disk mags.
2) Thanks for posting the Digi-Studio info.
3) I'm still confused about the RAM on a 1200xl. (I've even had mine for
about 9 years!) Does it have only 48k, or a full 64k? Will Digi-Studio
work on it?
4) Is it fully compatible with Parrot sounds, or is it in a different
format?
and..
5) Have you worked on a BASIC player or anything of the sort?

Thanks a TON! (This'll make the Parrot worth
a LOT more!) Bill Kendrick

Does anyone ever have trouble powering-up their 1200xl? Almost every time I have no carts. installed, I get a brown screen. Sometimes I get a brown screen and a few large yellow strips (sprites, I'll have to suppose). Does anyone ever have this problem? I usually just hit [RESET] and it starts the boot-up sequence, but sometimes that doesn't work, so I turn it off, and then back on. If that doesn't work, I flick it off and on really quickly (ouch!).. but then a few times, when it goes to DOS, it loads garbage onto the bottom of the screen, and whenever I do, say, a disk directory, I get garbage forcing itself on the center line, and the bottom of the screen and such (this was with MyDOS 4.53?.. this last happened yesterday, and the brown screen happens almost ALL the time..) Is this just a problem with the cart. slot, because it used to NEVER happen when I used AtariBASIC until I took it out to do something else.. ??

Thanks for any help in
advance, Bill

From: yoshida@eniac.seas.upenn.edu
Message-ID: <65469@netnews.upenn.edu>
Source record: 112513

I once had my hands on a music program that displayed
"moving bars of color" on the screen as the music played.
The dancing colors weren't the best part, I was mostly
impressed with the music. The same people that wrote this
music program (or maybe more aptly, music player) also wrote
the music for several games that were put out by _Paradise
Programming_. One was called "The Tail of Beta-Lyre" and another
was named something like "Cosmic Tunnels" something or another.

My question is, what is the name of this music player program?

It may have just been a demo, or a beta release that vaporized before
making it to the consumers. I had borrowed it from someone who's
bother worked for the software developers.

What's its name? Where is it available? Are the song files
available?

672. Huge .zip of games at atari.archive

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-09 16:54:21 UTC
From: fontana@cis.ohio-state.edu
Message-ID: <1992Feb9.165421.22004@cis.ohio-state.edu>
Source record: 112517

I was poking around last night on the archive and noticed a 1.6 Mb (!) .zip file called Atari800_Games_Com.zip, which seems to contain about 90 binary load files of old 8 bit games. The poster of this file is a genius; they were kind enough to duplicate every file in a separate 800k .zip STORED within the main .zip, making the file twice as large as it would normally be. Geez. [The file in question is in "pub"]

So what's the opinion? As atari.archive is the only major site in the U.S. with 8-bit material, I'd hate to see it get shut down because of this.

I tried the demo "awesome" recently posted there; it's pretty good. But I can't get the expo91 to work, no matter which version I try. (Corrected posting, atari.archive copies, etc.) I'm using SIO2PC; if someone has already made a disk image of it, I'd really appreciate a copy.

Thanks,

Mark

That software was written by Philip Price & I believe released through
Data Soft. Data Soft went to electron limbo & I've heard rumors Price bought
an Amiga. I think you'll have trouble finding it anywhere other then used
'cause I've never seen it at B&C or San Jose Computer in the last 5 years.
A pretty good alternative is Antic Music Processor. Music entry is a little
complicated, but the results are great.

The only player I remember that does this is Antic's AMP. Its really very nice, even lets you add lyrics. As far as where you can get this, I'm not sure. Is this public domain? If it is (which I doubt), I'll email it to you.

677. Homebrew RS232 possible?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-09 22:14:55 UTC
From: SOEF_16@leicester.ac.uk
Message-ID: <9202092216.AA17619@ucbvax.Berkeley.EDU>
Source record: 112519

How hard would it be to make a RS232 interface for the 800XL? Preferably
something that could plug into the SIO port and be a proper 'R:'.

I ask this because I want to connect up a modem and I think the
850 interfaces I have seen for sale are overpriced.

Does anyone have a circuit diagram of such a device? Alternatively, does
anyone know whether a SX212 modem (dirt cheap) would work in England?

It's in mapping, as well as the hardware manuals. Don't you think it would be better to spend 5 minutes and look it up yourself, as opposed to sending a request like that to thousands of computers around the world?

679. HELP!!! With Koala/Touch pad .pic graphics format!

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-10 00:17:46 UTC
From: jdz1@Ra.MsState.Edu
Message-ID: <1992Feb10.001746.3441@ra.msstate.edu>
Source record: 112523

Hi, folks:
I need your HELP! Read the discription below:

HELP FILE FOR 800+ 256K MOD

PIC FILES AND EXTRA DOC
SUPPLIED BY THE CHAOS BBS
(517) 317-1106

This disk has many files- including
5 picture files in koala/touch
tablet format that are REQUIRED for
completion of the modification.
Don't worry, there IS no pic for
figure 5 as it was too hard to draw
and the text explains it well
enough.

FIG1FIG2 PIC 3667 09-01-88 12:00p
FIG3FIG4 PIC 4307 09-01-88 12:00p
FIG6 PIC 3118 09-01-88 12:00p
FIG8 PIC 2656 09-01-88 12:00p
FIG7 PIC 3403 09-01-88 12:00p

I have these files unarced on my harddrive of my IBM AT. I can't put these
files On my Atari 800 becuase I don't have the equipment.
Does any one have the ability to diplay/print these pictures? I need
some one to print up these pictures and Mail them to me. Or even better yet
help me convert them to one of the more 'standard' graphic protocalls like
.gif that I can disply on my PC. I want to do this hardware mod but I can't
unless I can get these figures 8-(.
ANY help would be greatly appreciated.

Thanks,
John Zitterkopf

Source record: 112532

STEVE,

I don't think actually doing the RS232 hardware would be the worst.
Antic had a project for the Parallel bus that I think included a sample
RS232 port. The hardest part would be the software driver for it.
The Antic article didn't include a RS232 driver to my recollection.

Jeff McWilliams

681. Digi-Studio

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-10 11:43:04 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Feb10.114304.5510@aber.ac.uk>
Source record: 112528

I'm not exactly sure how much memory a 1200XL has. These were never sold in the UK, and I haven't had a chance to use one. Digi-Studio works fine on the 800XL and 130XE with 64K.

Parrot samples will work fine. Samples just need a .SPL extender to be loaded into Digi-Studio. Renaming them will work! Also, Antic Sampling Processor sound files will also work fine. This is because the Digi-Studio m/c player was based on the Antic player.

I started work on the tune complier yesterday. It asks for the name of the tune, the sample to use, and what lines in Basic you want the play routine to be situated at. The complier then creates a file in LIST format which you can enter into your Basic programs. This LIST file works in both Atari Basic, and Turbo-Basic. All you have to do then is copy the relevant tune and sample files to the disk your Basic program is on. An, hey presto!, you have digitized music in your own Basic programs. This program is going to be released along with the sample editor. Some new samples are also going to be included, as well as a few new tunes. The documentation for these programs (especially the sample editor) is going to be hard to write, so I think release of these programs is likely to be in a month, maybe more. The cost for these extra programs will probably be the same as the current D-S package available now.

Another person mentioned playing stereo Amiga files. Well, I am considering producing a stereo version of D-S, but in order to do this, I really need version 2 of the grumby stereo upgrade. I need to make sure that I am writing for the latest version before I start. Can anybody post version 2 details on here?? Amiga sample files would NOT directly work on an atari. The atari only has 4-bit playback resolution, so sample files are stored in a unique way on the Atari to save memory space. LOT'S of work would have to be done to convert Amiga samples of any description, let alone stereo ones, to work on the Atari.

Readers may be interested to know that Digi-Studio is not my first project into digitized sound. Before Digi-Studio were:

THE MUSIC MACHINE - early 1988. Bit crummy, but has a keyboard and joystick sound player, and creates Basic programs to play samples. However, the sounds do not play at real musical pitch.

D.S.I.L. - Digital Sounds Instruction Language - Nov.1988. A language based digitized sound manipulation again with keyboard player and tune complier. Again, samples do not play at real pitch. Also has a keyboard drum player program.

D.M.S. 1.75a - MARCH 1989 -Digital Music Studio. A new menu driven version of DSIL.

D.M.S. 2.00a - NOV.1989 - New updated version of DMS. Samples still don't play at real pitch.

Also, in the field of Digitized sound:

P.S.T (Programmer's Speech Tool) early 1988 - has 14 ready to play speech files for use in games. Has things like....game over, press fire to start,.. and so on. All Basic player routines are included.

BASH-A-DRUM - summer 1990 - A full drum pattern and song programmer. Has 9 drums, which can be played using the keyboard, 2 joysticks, or sequences programmed using a supplied editor.

Also, I have produced:

Digitized music demos #1 - 4 edited music samples
Digitized music demos #2 - 4 more music samples
Journey into sound demo - summer 1990. A big DS/DD disk full of edited digitized music.
Megablast - a 128K edited digitized music demo.

Everything except DMS, and Digi-Studio are PD. They are available in my PD library, and in the States from:

JEFF EDWARDS
138 SOUTH MAIN STREET
TRAVELERS REST
SC29690

He also still has distribution rights to DMS 2.00a.

Hope all this helps. That's if anybody has bothered to read all this!!

I recently uncrated two artifacts from my past:

Star Fleet Battles (star trek battle wargame)

and

Atari 800

Now I've already started to combine the two (a program to manage
some of the data involved with SFB) but I remember having at
one time a copy of SSIs "The Cosmic Balance", a very SFB-like
game.

Does anyone know where I might obtain a copy of this ... preferably
a legal copy with docs (I always said that when I had the means,
I would stop pirating).

Thanks to Jeff McWilliams for helping me out on my SIO-port shortage.

"Mark" at Innovative Concepts
31172 Shawn Drive
Warren, MI 48093
(313)792-1919 <<<<<<NOTE CHANGE OF PHONE NUMBER!

has an SIO port box with four ports on it for $34.95. There is no cable attached, so you gain 2 ports and have to supply a cable. I don't have a spare SIO cable, so that is another $5 for a total of $39.95.

Computer Software Services (CSS)
PO Box 17660
Rochester, New York 14617
(716) 586-5545
Ordering: 429-5639
FAX: 247-7158
BBS: 247-7157.
P.O. Box 17660
Rochester, NY 14617

has something called a Quintopus for multi SIO ports for $39.95. It has an attached SIO cable, so you are gaining 4 ports and don't need the cable. So it is the same price for more ports. They also take plastic over the phone so you get shipping faster. Made up my mind.

Hi Eric!

I created COLRVIEW due to a couple problems with APAC mode: it doesn't work on some monitors, and it can't provide the range of colors needed to display some GIFs. APAC works best with ordinary television sets, and certain monitors (Magnavox Color 40, Commodore 1702, and some others). But some monitors produce only a pale red/blue image when in APAC mode (this might be why you were unimpressed with it). When I discovered COLRVIEW, I noticed that it would work on those other types of monitors that APAC does not.

As for the "why 4096 colors?", even the best APAC versions of GIFs fails to produce certain colors. My monitor never could produce a decent yellow, or blonde hair, without some green in it. And the 256 colors that APAC produces are not always good matches for the 256 colors present in the GIF file. In addition, when I down-sample the (for example) 640 x 400 image to fit into 80 x 96 for APAC, I must average several pixels together (as many as 32) to produce a composite color. This color ends up being different than the original 256 in the GIF color table. So, for low resolution viewing, the more colors, the better.

I did this exactly, but the demo locks up!

I get (1) the snaking text title, followed by (2) a title screen with great
music and some color animation. Then I press START, the screen blanks, the
disk is accessed, some new music starts, then everyting stops; I have to power
down to regain control.

I have RamboXL and an XF551. Could the demo expect the timing of a 1050 drive?

I'm wondering what software uses 8-bit stereo. Am I mistaken in
beleiving that all XE's have stereo. I'm thinking about upgrading my
1200xl to stereo, but I'm not sure if it's compatible with anything. (It
adds a POKEY (?) and gives you 4 more mem.locations to use for sound
(right channel, I suppose).. also, with this upgrade, or the stereo that
the XE's come with (if they do), do you have the capability to go into
all those wierd sound modes (like 16bit and such)??) Thanks
Bill

Cool! I can't wait until I get Action! I got a windows toolkit ARC,
hoping that it would have a compiled demo., as at the time I knew nothing
about Action!, but from looking at it, it REALLY reminded me of PASCAL,
which I might ALSO get! If you want, I could send you the Action!
Window's Toolkit. Since I have yet to get a uudecoder, it'd just be the
source, NOT Arc'd, of course, and without the instructions, because
that'd be too huge. One day I'll most definitely upload it to the
archive, but for now.. I NEED A DECODER!!!! Bill

My 80col. "handler" will (eventually) add screen editing. It can already move a screen up, and I forget about down. I WON'T probably ever have logical lines, only physical lines. My demo (which is HIDEOUSLY slow at the moment) writes some stuff on the screen, and then draws a design and allows 1-key inputs (barely!). I only worked on it for about 1/2 an hour!, so what else do you expect!

Well... it hasn't been Atari Inc. since Warner Bros. owned it back in 84?
Now it's Atari Corp, and it really sucks. As of this month, Atari's
ended ALL 8-bit support (>I< never noticed any for YEARS anyways!) Antic
died last spring I think (I was amazed it lasted THAT long!), and Analog
died the year before ('90). Well.. we're still here... The die-hards!

Well... actually, not really. Hey.. speaking of ads, did anyone ever see
that Lynx ad with the kid at school who goes to the bathroom to play his
Lynx? Or the one with the four kids at the busstop or somewhere playing
Gauntlet, and they say something like "up to 4 people can play.." then
you see three of them as steaming skeletons, and they look over at the
4th, and then you here "but only >1< can survive!" or something. It was
pretty cool! I LOVE the Lynx, but for some reason I'd never get one..
(call it $? call it what you will!)... same with the Amiga.. For some
reason I'm sick of them!? (just call me DEVOTED!) Bill

In response to phbill's post on APACVIEW, etc.:

I'm the programmer of APACVIEW! Your explanation is essentially correct. The other mode you explained (page flipping full screens of graphics 9 and graphics 11) is called Pryzm mode. The latest version (2.3 I think) of APACVIEW supports this mode. The results were marginal on my monitor, with lots of flicker. The same files can be viewed in interlaced APAC mode, which alternates GR.9/11 on line pairs, and displays two screens with page flipping to maintain 80 x 192 pixel resolution. This mode is also supported by the latest version of APACVIEW.

701. EXPLORER PROPOSAL REJECTED! (resend)

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-10 22:21:52 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9202102221.AA00698@smithkline.com>
Source record: 112535

From: PHVAX::POEHLAND 7-FEB-1992 14:03:43.78
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: EXPLORER PROPOSAL REJECTED!!

After monitoring Net response to the offer from John Jainschigg of Atari Explorer Magazine to carry Atari Classics as a section of AE, it was clear the majority opinion was against it.

Just to maintain perspective here, I'd like to remind everyone the offer was made to me, personally. It was ultimately my preogative to accept/reject it, regardless of anyone elses' opinion. I had in fact formed my opinion of the offer within the first 12 hours of receiving it. However, it would have been foolhardy of me to make such a momentous decision- with far-reaching effects on the whole community- so capriciously. I shared the news with you for basically 2 reasons: I wanted to compare Net opinion to my own; & I wanted to see if any tangents/angles I hadn't thought of would emerge in the public forum.

Regarding those 2 elements, I report as follows: First, majority opinion expres-sed here on the Net confirmed my personal opinion, which was negative from the beginning. Second, such issues as people raised, tangential & otherwise, did nothing to give me cause to reverse my negative opinion.

Whereupon, on Feb. 4-5, I officially informed John Jainschigg that while I was grateful for his consideration, I respectfully must decline his offer at this time.

The wording of the offer raised a few emotional issues which I chose to brush aside. It was basically a business proposal, in my response to John I chose to evaluate it that way, & Ithink most of the response I saw here on the Net saw it that way also.

There were 3 sound business reasons for rejecting Explorer, as follows:

1.) He offered us 8 pages, 6 times a year. Even assuming Explorer really did publish 6 times a year (a BIG assumption), we would have only 48 pages. This is paltry. In 1991 alone, with far less resources at my disposal, I published ca. 90 pages in Current Notes, & could have done more. A paltry 48 pages/year isn't worth doing; Current Notes is a far better option.

2.) There was the problem of once again having to compete for page space with Atari's other products. This is the same problem we now face with both AIM & CN. Since AIM & CN, respectively, already command most of the market, & most 8bitters already resent having to page thru that other stuff to find the items they want, Explorer offered no advantage in that regard. It would just be more of the same; more of the same is not what

we want.

3.) One item no one mentioned, is that the community is now so small it no longer has the resources to adequately support even the 2 major magazines we now have: AIM & CN. (It is my opinion that this dichotomy of publications is actually contributing to the fractionation & decline of the community.) The entry of Explorer into the market in a major way would accelerate the process of disintegration, & ultimately be harmful to the community. A major objective of Jeff McWilliams' mail survey campaign is to CONCENTRATE our remaining resources into one single common forum, & thus hopefully to restore our splintered market to critical mass.

There were some personal issues, of a minor nature, which I also had to consider. As a scientist I am a rebellious fellow, distrustful of authority. The more autocratic the authority is, the more rebellious & distrustful I become. Any of you folks ever looked at the masthead of Explorer? It's top-heavy with guys whose last name is Tramiel. Now look up the definition of "autocrat" in your dictionary; you'll find there a picture of Massuh Jack. Sooner rather than later, I would come to grief working in such an environment. I need to feel that whomever I work with are people whose motives I can trust, whose efforts are sincere, & whose style of communication is on par with my own. I just did not get any of those vibes from John.

To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: CN Hires New 8-Bit Editor

I was just informed earlier this week that Current Notes Magazine has a new 8bit Editor, an event which seems to have occurred about 3 weeks ago.

He is Rick Reaser, 8bit VP of the P3ACE group in Colorado. Rick produced the excellent review of the new ChromaCAD program that appeared in the December 1991 issue of Current Notes.

Rick will be running a column called "8-Bit Tidbits". I'll be assisting Rick in the startup phase of his new job- turning over unpublished manuscripts, advising about articles, & giving him copies of software to arrange reviews. In these times of uncertainty in the 8bit community, Rick will continue the tradition of excellent coverage that has characterized Current Notes in the past. Hopefully material that was delayed as a result of my departure will soon go into the pipeline & might appear as early as the April issue.

Rick has already announced strong support for the concept of an independent 8bit magazine & for the mail survey campaign now in progress. Let's all wish him well in his endeavors, & I myself look forward to working with Rick during the transition period of the next few weeks.

I now routinely send all my IA8 postings via CSA8. The sysadmins here tell me we can'T send things to UseNet. By substituting dashes for the dots, it goes thru. I told our sysadmins I was sending msga to UseNet like this, they said it was impossible. OK, if they say so, I'll just keep on doing it <chuckle>.

My only frustration w/CAS8 is that sometimes postings are delayed or don't seem to go thru. For example, I just re-posted 2 msgs that I sent via CSA8 on Feb. 7. Now I see stuff in IA8 #41 that was posted Feb.8&9, etc., but my Feb. 7 postings failed to appear. Or, is this some kinda gotcha, like in the next IA8 my postings will appear TWICE. So then people can say, Look at that Alchemist guy, what a dummy he must be!

Sorry if I sound like I'm ragging here, but some days the Net makes me CRAZY.

YEP! 1010- Sells used for $5-10 depending on whos looking for a door
stop.. (hehee). Most of the time people give these away locally.
I cant see much use for one unless youve got a supply of cassettes
that you want to convert to disk. The prices on used drives is VERY cheap
and so it makes a 410/1010 a doorstop or collectors item.
Ive got an 835 modem here so I know what a "collectors" item is.
I get people asking me to take their 1010's and 410's away!
As for the 1027-- ITS a piece of junk. Dont fix it.. CHUCK it and
buy an interface and a standard type of epson compatable printer.
Youll appreciate how much better it is than the 1027 is.

I think your talking about something I wrote. I was talking about BBS PRO
software which DOES lose time during disk I/O, and I am NOT INCORRECT!
Bobterm adjusts itself to put time back on the clock while it accesses the
disk, but it too, is quite inaccurate if you were to leave the program and
computer running for a week or so (like a BBS would need to do).
Bobterm is set up to put more time back on the clock as near as I can tell.
When I do file downloads to a floppy, while its writing the disk, it freezes
the clock on the screen, then adds the time back to make up for the freeze.
This is not accurate.. An Rtime8 is needed as its EXACT!
It DOESNT lose time. Im even told its more accurate than whats inside the
IBM PC's for keeping time.

As someone pointed out earlier...you must diskcomm to an enhanced-density
disk and change the max sector count when you run diskcomm.

I changed the sector count to 1040. I'm probably wrong here. I know DOS 2.5
gets 1024 sectors. Just the same, it seems to me I read somewhere that there
really are 1040 sectors but DOS 2.x uses 10bit sector numbers and the 6
leftover bits for file numbers.

If diskcomm gets a little past 720 sectors you will know that you have done it
correctly.

The demo really is cool!

> online. Maybe I am missing something here?
>
> Jeff McWilliams

Jeff, he is trying to set the clock that bobterm uses.
When you are online with bobterm, its impossible.. UNLESS! You use
spartados and the spartacommand line processor and go into it while online.
I think if he is using dos 2.5, Its not possible to do.. unles IM
missing something. Theres one clock with Bobterm... online time and
REAL time....in the same upper right hand corner...
To set it, (as you know) he would use spartados and then type
TIME (return) and enter it in.. I dont know if the TDLINE utility will
work with dos 2.5 but this might work.

Its nice to have correct time while online I guess.
No big deal though.

714. Anyone know how to transfer Cassette Bootables to disk?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-11 05:49:45 UTC
From: jdz1@Ra.MsState.Edu
Message-ID: <1992Feb11.054945.24878@ra.msstate.edu>
Source record: 112549

Howdy....
I have a few cassettes that I would LOVE to transfer to disk. My 800
doesn't have Basic built-in. I want to transfer Zaxxon and Blue-Max to disk
if it's at all possible. My other cassettes were witten in BASIC so they were
easy to "copy". Anyone know how to transfer Bootable Cassettes to BootDisk
on a 810 drive? And _YES_ all of my equipment is outdated. I'm poor and a
full-time College Student...
Which Reminds me that I have a NETWORKS I lab report to type...

I had better go...
Oh, By The Way, Email me the Responses when possible. If there is interest
I'll post to the NewsGroup.

Thanks,
John

720. 1027 Printer Problem

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-11 15:43:58 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9202111543.AA02997@smithkline.com>
Source record: 112462

I disagree quite sharply with Craig Rothman's advice to Tony Falcone (IA8 #42, 11 Feb 92) to trash his 1027 because of its apparently erratic behavior.

As one whose primary printer(s) for many years was(were) two 1027's (one of which I still have), it is my opinion that the 1027, properly maintained, is just as useful & productive a piece of machinery as any other peripheral.

Tony's problem is not primarily one of hardware, but rather a lack of information. Tony needs to lay hands on the Feb. 1991 issue of Current Notes, where he will find an article titled "Secrets of the 1027 Printer". In that article Tony will read the very symptoms he describes, & how easy it is to fix. The problem is lubrication. Use Lube Gel from Radio Shack, & make sure ALL the bars get lubed, not just the head bars but striker bars also (I think there are 4 bars altogether, not sure of the details here). You have to disassemble the case to do it. THe article contains detailed instructions for disassembly & lubing. It should be done about once every 2 years, & you should NEVER touch the bars with your <sweaty> fingers.

The only REAL problem with the 1027 is getting reliable replacement ink rollers.No one who uses a 1027 should EVER throw a used one away! The reasons for this are described, in hideous detail, in the CN article.

The article was written by The 8-Bit Alchemist.

721. Digi-studio

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-11 16:17:41 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92042.111741JJMCWILL@MTUS5.BITNET>
Source record: 112468

Since the Parrot and Parrot II are hard to find, I was wondering if
if there are any other sound digitizers out there for the 8 bit system.
I have an Analog to Digital converter here, that eventually I am gonna
hook up to my Atari via a PIA project, probably on the Parallel bus, that
would allow up to 8 bit resolution data sampling, at up to 800,000 samples per
second. Obviously you wouldn't run it full out at 800K for sampling,
not even my 1088K Newell upgraded 800XL would be able to store much sound at
that speed!

My point though is, if I were to work on such a project, probably not for at
least several months, what with the campaign and college, would people be
interested in it? Would anyone be SERIOUSLY interested in writing software
for it to make Parrot or DIGI-Studio compatible files? You could also
rig up a separate 8 bit Digital to Analog coverter, for nice 8 bit digitized
sound if you don't like the internal sound of the 8 bit.

722. Atari 1200XL/1050 worth?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-11 16:27:22 UTC
From: Darius Vaskelis <U39648@uicvm.uic.edu>
Message-ID: <92042.102723U39648@uicvm.uic.edu>
Source record: 112469

Sitting in my closet gathering dust is some Atari 8-bit equipment:

Atari 1200XL Computer
- with Atari 1200XL Rev. A ROMs
- with ICD's Rambo XL 256K RAM upgrade
- with the jumper added inside to allow power from the SIO port
(This allows the P:R: Connection and other peripherals that draw
power from the SIO to work, they normally are not 1200XL
compatible. I put the jumper in to get a P:R: Connection to
work, which isn't for sale since I have no idea where I put
it. Maybe I loaned it to someone?)

Atari 1050 Disk Drive
- with ICD's US Doubler for true double density and UltraSpeed

The 1200XL is in 100% perfect working order, and the keyboard is fine
too. (Probably the best thing about the machine!)

The 1050 works, but is in worse shape. First, the external power
supply is shot and needs to be replaced. Second, there's a piece
of metal that felxes when the drive door is switched from open (up)
and down to the side (closed). This piece is broken. I can get the
drive to work fine if I manually close it carefully with the cover off.

Additionally, I've got 20+ cartridges for this, including OSS's BASIC
XE which works fine. (It still leaves room for a 128K RAMdisk with
SpartaDOS...) The rest of the cartridges are just gobs of games,
and a BASIC rev A cart.

Additionally, tons of diskettes with a silly amount of software.
Most are SpartaDOS DD punched so that they are "flippy."

Let's see... I've got a joystick and a trackball around somewhere
for it... both third party. Books too, including: Mapping the
Atari (Revised Edition), SAMS Programmer's Reference for 400/800,
all the Atari/ICD/OSS manuals, and some not-so-great ones too...

(GEEZ! I just realized the amount of stuff I've got for this thing.)

Anyway, to cut to the chase, I haven't used this stuff for many
years now. I'm willing to sell it. What the hell's it worth these
days? I'm willing to trade for IBM-type stuff, especially anything
PS/2-specific.

1992 TRENTON COMPUTER FESTIVAL

TCF needs lots of volunteers to be a success. This year, volunteers are eligible for special prizes in their own drawing!

By volunteering four hours of your time, you will also receive a free two-day ticket to this year's annual Trenton Computer Festival, April 11-12, at MCCC, a colorful cap and a free lunch ticket.

Volunteers work in several areas, as needed by the organizers. Some of these are (1) helping Security to direct traffic, (2) helping speakers and people attending talks, (3) providing general information to attendees, (4) selling tickets, (5) helping in the flea market area, (6) helping in the vendor areas, (7) checking for tickets at the doors, and so on.

Thank you for volunteering. Have fun!!

I. Personal information:

NAME:_____

HOME (Evening) TELEPHONE:_____

WORK (Day) TELEPHONE:_____

II. Please make three choices from the list below:

SAT:6-10 SAT:10-2 SAT:2-6 SUN:8-12 SUN:12-4

First choice:

Second choice:

Third choice:

Return the completed form as soon as possible but no later that April 1, 1992. You will receive a telephone call from the coordinator of volunteers telling you when to report. Go directly to the lobby of the Theater Building on the MCCC campus to get your tickets, cap, etc. and your assignment.

Thanks a lot for helping!

Pete Holsberg

726. Upgrade boards? 65816, 65802, 4 or 8 MHz?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-11 20:40:58 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Feb11.154058.9133@miavx1.acs.muohio.edu>
Source record: 112473

What's up with Dataque's 65816 upgrade board? I saw a little of it in Chicago, but I didn't get a chance to talk to anyone. I would really like to get some more speed for my XL. After seeing the the accelerator boards for the ST, wouldn't it be possible to make a board that runs internally at 4 or 8 MHz, and slows down to 1.79 when it has to access memory or GTIA, or POKEY, etc? If you put a small cache on the board, of say 16K, the performance increase would be substancial. The reason I mention the 8MHz speed was the fact that it is possible to get a 65802 that runs at 8MHz. It is pin compatible with the 6502 and it still has the 64K address limit.

Dataque's board could already do this, but I haven't heard anything for awhile. The only other problem would be price. The board would have to be cheaper than $70 dollars to be successful.

Later.......

727. MyDos, US Doubler questions.

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-11 20:49:49 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Feb11.154950.9134@miavx1.acs.muohio.edu>
Source record: 112471

Maybe I overlooked something, but how does one get MYDOS to use my
US Doubled 1050 in high speed mode? I've given up on using SpartaDos,
too many problems with software, and I like how MyDos sets up the
default drive. (Now I just got to send in the shareware fee!!)

On a related note, does MyDos have a way for programs that don't
know about subdirectories to be able to change directories? (I remember
reading about DOS-XE that when you are in a program, if you tried to
load a directory, DOS-XE would change to that directory, and return a
load error to the program, so you would be in the new directory. I can't
remember how you backed out of directories though.)

A suggestion to the person writing a CLI for MyDos. PLEASE provide
some sort of path command!! (I would love to be able to put all my
utilities on my ramdisk (D8:UTIL) and be sitting on D1: and be able to
type "unarc filename.arc" !!!)
Also a pwd prompt and alias command would be very nice. Also, the
ability to have external programs be written in Atari BASIC. (That way,
if someone wants to write the greatest directory program, they could
have the prg LS.BAS and be able to invoke it by type just "ls")

Later.......

What you seem to be describing is what Chuck Steinman (of DataQue) has already done with something he calls GameLink. He released a hardware spec and a sample game (two player tic-tac-toe) for two systems to play. His final conclusion was: this type of communication is much too slow for any major applications.

He and I have worked with what he calls GameLink II, which connects the serial lines together. This allows up to 32kbps communication when handled correctly. His spec for this (and GameLink I) are both available on GEnie.

I am still working on an interactive multi-player (up to 8) game involving this concept. The serial communications part of it is beginning to work. We had started an area on GEnie called the "Atari Games Designer Arena" or AGDA for discussions of just such games. People were real anxious to give us their grand schemes, but fell short when it came time to implement them. I am pledging to finish this game in the near future. Let me know if you are interested in hearing more about it....

There's already an Atari linker for games called the Game-Link if I
recall. I have a battleship game that was unfortunately not described as
2 computer, so it just sits useless on one of my disks. E-mail me and
I'll remember to post some info. on it (like where to get it). It does
work through the stick ports, so it'd be fairly simple to use, if you
timed everything correctly. Bill

With what DOS!? I have no RT clock CARTRIDGE for one, but I suppose if I
got some handler I could do it. Also, I guess you could use [K]-DOS and
[H] load module in BobTerm to do it. (I loaded Xagon once, and the colors
were screwed until I hit [reset].. it was pretty snazzy!)

I just hate having something so keen, but also so useless without paying
$40 for a clock! Also, with spartados (which I haven't yet got!), does
it date/time stamp (yes.. I think I remember hearing).. and does it ONLY
use the RT8 cart!? Because if it does, a handler like I mentioned for
BobTerm would be good for SpartaDOS instead of getting 00:00:00 01/01/80
on all the files! Well!? Bill

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <9F0ZFB9w164w@cyberden.uucp>
Source record: 112358

The color bar player was called AMP (advanced music player). I have two demos. Strike Force or something (pretty patriotic.. sounds good), and ALTREAL or ALTREALITY.. I thought it'd be some music from Alternate Reality, but it wasn't.. It wasn't that good. There's also a program to convert .AMS files to loadable .AMP files or vice-versa. I'm not sure. They were both on AtariBase, so anyone near San Jose, maybe upload it to the archive. (I'm just a bit too LD! $$$!)....
Anyone see ballsong? Now THAT was groovy! Sort of a dumb song, but I like the 3-d bouncing ball (that is, bounced left-right, up-down, in-out!).. Oh.. I remember, it was called AirStrike, not Strike Force.. I was close. But, yes, those AMPs are pretty cool.
Is FujiSpin or FujiBonk on the archive? I have FujiSpin, and that is RUDE (no music :(, but RUDE animation!).. and FujiBonk I can buy PD for $4.. And, finally, is RobotSpaceShip (or whatever) demo on the archive, because it, too, is a cool demo, and I'd gladly upload it once I figure out how. It has the Atari Fuji, just like in FujiSpin, but instead of spinning, it shows a big, 16 shade robot walking down a hall way, and it plays robot-music.. then it shows the fuji again, then a space-ship, again in 16 colors, flying through space. (I think it was only 1 layer scrolling for the stars, though, but still, the ship looks mighty realistic..), and it played hero-type space music. Anyone seen 'em?
Bill

>department.)
>
> Comments?

Just a little something I found out about the //e while programing
a simple game on one. The thing is set up with negative memory addresses
and the allocation of string memory tended to overwrite the graphics
memory. (and this is from puting the gaphics shapes where the manual said
it would be ok). I dont know if this could be overcome in an emulater or
not. In every way I found the apple //e to be less of machine than either
the 800 or 130XE.
The memory overwrite I described above scrambled the
the graphics screen, and I overcame it by reducing the amount of memory
I used for the strings.

>beleiving that all XE's have stereo.

As I'm sure forty other people have jumped in to say, yes, you're mistaken.
No Atari 8-bit computer has ever been produced with "factory" steereo sound;
we pretty much "pre-dated" the "need" for stereo sound in a home/desktop
computer; heck, SOUND was new when the Atari first hit the street...

Nonetheless, I have seen true stereo music produced on a STOCK Atari 800:
a little melody played in two-part harmony, one "channel" emerging from
the POKEY-driven "audio output" (i.e. finally coming out of a TV/monitor's
speaker) and the other out of that little metal-disk "console speaker" in
the 800 case itself! It was a wonder of careful instruction timing, and
I saw -- er, HEARD -- it around 1985 or 86...

>info in the video? By using an on-screen tape counter?

I don't think Frank DOES expect to be able to "repeatedly seek" to the same spot... That was ANOTHER of our "missing components". It wouldn't be a problem if you were willing to pull files off the tape in order of their appearance; writing would be "VCR_RUN,write_data,VCR_STOP," repeated; reading would be the same only with "read_data" in the middle. We did come up with the idea that "since you're using a VCR," we could intersperse VISUAL index frames/segments: fast-forward in "cue" mode until you see, on screen with static and all, the GRAPHICS-2 (or larger custom display) legend, "video games 1980", then stop, PLAY in normal mode until the legend disappears, then engage the data-transfer mode... This is just a very rough idea that occurred to us as one possibility...

Ryan,

To my knowledge there isn't a modified version of MYDOS that will use
US sector skew mode. You have to either buy the Ultraspeed PLUS OS chip,
or a Black BOX. Both will make any DOS use Ultra Speed mode.

I'm not sure if there was a connection between Data Soft & Data Most, but
I know for sure Tail of Beta Lyrie was done by Philip Price with the music
by Gary Gilbertsen(sp?). They also collaborated on the Alternate Reality
series which was released under the Data Soft label.

See how the sound sampling goes with the DMA on. True you might not be able to get reliable sound this way, but at least you can get a close to the original sample rate when both the DMA's are on. See what happens, It's only your Time, 8-).

Enjoy!
John

755. MAIL SURVEY CAMPAIGN GOES INTERNATIONAL

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-12 21:38:06 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9202122138.AA11626@smithkline.com>
Source record: 112493

Although Jeff McWilliams' press release announcing the launch of a write-in campaign for Atari Classics initially stated the Campaign would be limited to USA residents only, he has received a number of responses from interested parties residing outside the US.

After some palaver & headscratching over this, we decided it would be within the capacity of our <limited> resources to make a modest expansion of the Campaign into the global arena.

Individual mailings to non-USA addresses will start going out this week, with highest priority given to Canadian addresses. Info-Kits sent to foreign participants will be essentially identical to those furnished domestic participants. The only difference will be a slight modification of the means of returning the postcard form; it must be mailed in a small envelope (furnished in the Kit) to our USA mail drop address. The participant will need to affix the postage required by his/her country to the USA. Upon arrival at the mail drop, the card will mailed to Jeff in the normal manner via US Mail. This is more expensive- both for us & the participant- & is a bit more clumsy, but it will permit foreign participation without compromising the format we have established for validation & ease of handling the large volume of data this Campaign is generating.

A special information note, containing detailed instructions for non-USA residents, will be included (along with the preaddressed small envelope containing the return card) in all Info-Kits sent outside the USA.

So..... you folks in Canada, UK, NZ, Down Undah, & anywhere else English (or some variant thereof!) is spoken, this is your chance! You have spoken, & we have heard you!!

Send your name/mailing address to:

Jeff McWilliams
INTERNET: jjmcwill@mtus5.mtu.edu
GEnie: J.MCWILLIAM3

Thank you all for your interest & enthusiasm! Response so far has been very gratifying. Despite stepping up weekly production of Info-Kits, I'm having a tough time keeping up with the demand <GRIN!!!>.

>not. In every way I found the apple //e to be less of machine than either
>the 800 or 130XE.

Most of these issues are related to Applesoft BASIC, not specifics
of the graphics hardware. Still, I think an Apple //e emulator
would be a big waste of time because (1) almost all emulators are
a waste of time, and (2) who would want to run Apple //e software
on an Atari computer? I think the effort spent developing an
emulator would be put to better use designing some decent Atari
applications.

Source record: 112494

Marek,

Thanks for the info regarding your home-brew digitizer. Radio electronics
has been doing a series on A/D conversion, and I plan on getting the
missing issues so that I have the whole set. They are using the same series
of A/D converters I am, and their diagrams are pretty interesting. They even
show how to hook up the A/D for other things,like light detectors, temperature
probes, etc. They say a good sample rate is 11kHz or 22Khz for really decent
sounds. Of course, if you have to lop off the least significant four bits
to play it back through the Atari sound, you lose resolution, which is why
having the D/A to play it back through would be best, but to begin with
I'd just like to get something somewhat parrot compatible, or Digi studio
compatible. The reason they are turning off the DMA is because ANTIC
takes 30% of the processor time. I suspect turning it off lets them count
clock cycles and get the timing right. There must be a better way.
Perhaps hooking up a 22kHz/11kHz clock to the IRQ line of the parallel BUS,
then the IRQ handler would be fetching a sample every IRQ, and with the
D/A output board, putting it back out. You're still talking about moving
and storing a lot of data though, the biggest drawback. At 11Khz,
11K per second is needed for 8 bit sampling, or 5.5K for 4 bit sampling,
which is for Internal sound playback. 22kHz 4 bit sampling similarly is 11K
or 22K for 8 bits resolution. That's where 256K and 1088K upgrades come
in handy, but geeze, you almost need a removable 44meg hard drive to store
all the digitized data!
With the proper software, you could have all sorts of fun with A/D
converters, like the mentioned light and temp . probes. This would especially
make great science projects and stuff.

Sigh... so many neat projects, so little time.

Message-ID: <"92-02-12-15:35:25.62*UJ1G"@DKAUNI2.BITNET>
Source record: 112488

Jeff,

you want to build your own digitizer with an Analog to Digital converter? Then do it. It's not very expensive as one might think. You'll have a lot of fun with it.

I've built one with the ZN427 A/D-converter using a diagrame from the German 'ATARImagazin'. It is hooked up to the joystick port allowing up to 8 bit resolution data sampling. The sampling speed is defined by the article up to 48 kHz which is (theoretically) as fast as you have it in your CD-player. Then the whole 48KB Ram last only for about 1 sec of sound. The type-in sample program uses only the 4 high bits of a sampled byte.

The whole sampler came about 40 DM (less then $30) and it's doing extremely well.

Thus I have one problem with it or better to say with the program. While sampling, it switches off the DMA (POKE 559,0).When I try to use the sampled sound in BASIC with the DMA turned on (POKE 559,34) the sound isn't recognizable any more. It's fine again when I switch the DMA off. As I want to use the sound for games it makes no sense. You can't make a good game without using graphics or at least text. Any idea how to overcome this little problem?

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <cm72FB3w164w@cyberden.uucp>
Source record: 112359

You said something about a few of the programs not playing in regular pitch. Does this mean that Digi-Studio or any of the others play at regular pitch? (If I understand what you mean by that...) What I'm thinking is say somebody sung a middle-C note into the computer, and you played it on the middle-C "key" of the computer. It would sound "identical" (or as identical as an 8-bit can play back!) to the sung M-C. So, if you hit an A note, it would be an A but at the same speed, not faster or slower? Now THAT would be cool. Having both varying speed AND varying pitch.. (like a real fast low note) would be awesome. I can see that it might take a bit more of moving the info. around (as stretching sounds for slower playbacks, and removing them for faster), but perhaps the ML play routine could handle that by not reading 2 bytes, playing, reading another 2, etc... but rather read 2, play, skip 2, read 2, play.. etc. That would be about 2c as fast. Can ML do this quick enough?

BTW: Is Mac or IBM soundblaster sound any better than the 8-bit? I've heard the IBM SB, and it doesn't seem to even be as good, except for the fact that the IBM has so much mem, and it's 16bit, so it can probably hold more sample space, and also can sort of understand you (from what I've seen). And for the Mac.. I saw it and a few other computers on some strange new tv show about computers (not even on Public TeleVision!!) that sort of reviews items as it teaches you.. well, to cut a long story short, they had 2 Macs, a new one and an old one with a sampler/playback device attached. (they didn't show the new Mac, because the sample software that was built in sucked). When they played back the sound, it had that sort of tin-can noise in the background, like I've heard on almost all the samples I've seen on the 8-bit. Can this be true? Does the 8-bit have digitized sound just as good as a Mac?
Thanks for any upcoming 8-bit sound info. (VERY interesting!) Bill

Whether you're reading this on UseNet, the Internet, or CompuServe,
I'd like to encourage the 8-bit Atari hardware/software developers out
there to consider the Cleveland Free-Net Atari SIG as an easy way to
get the message out about your new products.

The Cleveland Free-Net is part of NPTN, the National Public
Telecomputing Network. Its users either access the system via modem
or via the Internet.

Developers may send press releases to: xx004@cleveland.freenet.edu

The Atari SIGOps will then post your release to the Atari Product News
board, in the Product Information & Support area of the Atari SIG.

-Michael Current, Cleveland Free-Net 8-bit Atari SIGOp

$.02, I talked with the guy who did the transkey & Genlock & he sorta floats the clock speed of the Atari to match the video signal. He said he believed it to be possible to run the clock faster during the VBI, but you run into other problems. Other then the circuits needed for two seperate clocks, there's page 0 RAM access times. The reason we have 150/120 nsec RAMs in our computers is because page zero is accessed twice as fast as the rest of the address space. To get a sizable increase in processing power (2X) you'd have to switch all the chips to 60 nsec or faster. It'd be a great hack & for some operations it'd certainly help, but you gott'a figure the cost of fast RAM + the new processor into your price. I'd bet the upgrade would cost $79 in parts & PC board alone W/O any profit.

768. Heads up 8 bitters!

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-13 17:48:56 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92044.124856JJMCWILL@MTUS5.BITNET>
Source record: 112361

Heads Up, Atari 8-Bitters!!

This Is For YOU!

Beginning 1992, the Atari 8-bit computers- and the community of
USERS who still cherish these machines- have been officially discarded
by Atari Corporation.

BUT WE REFUSE TO ROLL OVER AND DIE AT ATARI'S COMMAND!!

We believe there are enough of us left to pursue our 8-bit
interests independently of Atari Corporation.

Would you like to see a common forum in which users, developers,
and vendors can communicate? A print medium wherein advertisers can
be assured of reaching their intended audience, and where users can
look with confidence for information about new products? A user-
oriented publication to fill the void left by the collapse of ANTIC
and ANALOG?

My name is Jeff McWilliams, and I'm a dedicated 8-bit user. I
want to present the Atari 8-bit community the chance to gather under
one publication dedicated exclusively to the Atari 8-bit computers. A
magazine that will unite our community and give it the strength it
needs to survive. A forum where users can ask tough questions and
read unvarnished product reviews. A magazine whose ads will be almost
exclusively from 8-bit vendors.

I propose a write-in campaign to Atari Interface Magazine, asking
for a separate, exclusively 8-bit magazine called "Atari Classics".
Atari Interface Magazine already has a strong presence in the Atari
community. For several years AIM has been a combined ST/8-bit magazine
whose publishers have indicated a willingness to support the Atari 8-bit
community as long as interest warrants it. NOW is the time to ask them
for our own magazine!

As Campaign Manager, I will act as the focus for this effort. Now,
you might be wondering, "WHAT CAN I DO TO HELP?". That part is EASY!

Just SEND me your NAME and POSTAL MAILING ADDRESS. I will mail you
a FREE Information Kit describing our goals in greater detail. Included
with the Kit is a stamped postcard on which you can express your
interests and willingness to subscribe to an exclusively 8-bit magazine.
(Or, if you disagree with our approach, you can just toss it away and
that will be the end of it- BUT WE DON'T THINK YOU WILL!) You'll also
be invited to indicate your willingness to PARTICIPATE in the magazine
DIRECTLY by being a regular columnist, editor, or just writing about a

special project you did or review a product you used.

Ben Poehland, the former 8-bit Editor of Current Notes Magazine, is fully supporting this campaign and has offered to donate his services to "Atari Classics" when repairs to his fire-damaged home are completed later this year.

The cutoff date for receiving the postcard responses is:

MARCH 31, 1992.

If by that time I have received 500 positive commitments via postcard, they will all be sent to AIM along with a petition requesting the formation of our proposed exclusive 8-bit publication "Atari Classics". If I receive less than 500 replies, then we will know that the 8-bit community has indeed become a lost and hopeless society.

TIME IS RUNNING OUT. THIS MAY BE THE LAST OPPORTUNITY YOU WILL HAVE TO KEEP YOUR MACHINE ALIVE AND SHARE EXPERIENCES WITH FELLOW USERS.

IMPORTANT!! Only the OFFICIAL Campaign postcards will be accepted! Those responding by other means will be mailed an Information Kit with which they can register their official response. Regrettably, due to limitations of time and cost, the Campaign will be restricted to addresses in the USA only. However, unofficial responses from outside the USA are welcome and will be included in the final count.

PLEASE DO NOT SEND MONEY! If anyone wishes to assist the Campaign, they can do so by posting this release in its unmodified entirety to other on-line services, BBS's, usergroups, friends, and vendors. Additional assistance can be rendered by gatheringnames and addresses of Atari 8-bit owners and furnishing them to me so I can mail them an Information Kit.

If you're REALLY SERIOUS about keeping your Atari 8-bit classic computer alive, be sure to obtain the Information Kit and return the included postcard appropriately filled in. Every day more 8-bits get stashed in attics or closets, or simply thrown away. Atari's Classic 8-bit computers- the 800/XL/XE machines- are every bit as useful and productive today as they were in the heyday of 8-bit technology. They deserve a better fate than the local landfill!

Yep, I discovered that the other day. Pretty stupid of me to forget about that internal BASIC... (Gee, I wonder WHY I'd forget about BASIC??? :-)

Yes, whoever put the file there should have beed more careful.

And, the files should have been arc-ed (unzip rare to extinct on atari 8 bits).
And, the files should have beed arc-ed separately.
And, the files belongs in atari/8bit/new.

But most of all, many of the games apear to be PIRATE copies of software that
is currently available from mail-order venders at very reasonable prices.
THIS is what may threaten the existence of the Atari 8-bit archive!

>NOTHING about the relative "clock speeds" of the Apple IIe and the Atari.)

This is simply because the Atari guys had so many different resolutions to worry about. Remember that you can use DrawTo in the text modes. They went for the general solution of using floating-point calculations and dealing with an abstract coordinate space and then just calling a routine to plot a point. This meant they could write one reasonably short routine that could draw a line no matter what mode you were in. The trade-off being that they didn't do anything to take advantage of any knowledge of the way the memory was laid out.
I remember seeing (although I don't remember where) and probably even writing line routines that would take advantage of being able to do multiple pixels in a byte and using registers for more speed. I don't think I ever went so far as to write self modifying code, but that would probably be the fastest. But then you need a version for every different screen organization.

772. StarTrek II basic sound demo {was: Re: Digi-Studio

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-14 01:25:35 UTC
From: jdz1@Drum.CC.MsState.Edu
Message-ID: <1992Feb14.012535.24718@ra.msstate.edu>
Source record: 112367

Howdy, 8-bitters...
I delveloped a basic program that plays a fairly good theme song
for Star Trek II, The Wrath of Kahn. It's written entirely in BASIC
of the ATARI 800 kind. It's slow but on my machine it sounds pretty darn
good 8-). MUCH better than an IBM!!! The only problem is that I can't
get it out to you all because I have no communications outside of the
800 as of yet. I could get you a printout of the BASIC program, but`
I`d be willing to bet you would not want to type it in. It takes almost
all of the memory to hold this file. I even had to convert the data
statements to graphics characters to save memory for the full song.
I'm planning on building the SIO2PC interface, and when I do, Would any
of you like it IF I can post it to the newsgroup OR atari.archive?
I could mail you a disk with it, but that would cost you money for
the disk and mailing to your location. The program uses all 4 voices
in Atari Basic to give different levels of playing music. All and
All It sound pretty darn good. I was reading all of the SOUND stuff
on this subject and I just though I would put in my two cents worth!

Later,
John

Let me look up in one of my old magazines. I saw some other stuff,
(including the sound-mouse, which is probably little more than a Clapper
(clap on!! clap off!! :))...

Ok, it was in the "talking ataris" issue of Antic (Jan 87; Vol5,#9)..
page 16. They had the Covox Voice Master, which is an actual voice
recognizer.. it was only $89.95. It used the .. it came with a
blackjack game and a calculator.. It talked using synthesis AND
digitization (if I'm not skimming too much.. I hope I'm not too wrong!)
It also adds BASIC commands (it says "(19 on the Atari 800) for use
anywhere in your own programs. These include LEARN, SPEAK, TRAIN and
RECOGnize." It looks pretty neat.
Then there was the soundmose from soundsof.. It came with software
that could play music to the beat of say music you have nearby or
something.. sounds pretty good.. I wouldn't want one.

Opps! All the other stuff I started listing, like the Hippo, and stuff
from Finally software.. was only ST... Oh well.. I could've sworn there
was other stuff around.. I guess not, but the above list is still pretty
interesting. I wonder if there is anybody out there willing to give any
of that up? Bill

Humm... You could be right. But, I have built a speech synthizier
and a Sound Syn. for the 800 using the joyports as communication lines
between the device and the Atari. I have had know real speed problem.
Ofcourse both of these devices have to tell the computer to wait for a
few milliseconds while it completes it's task, like speaking the 'a'
sound. The joyports work VERY well for this type of hardware hacking.
Expecially when you need some parallel data lines!

780. Blue Max on 600XL

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-14 11:13:29 UTC
From: etxansk@garbo232.ericsson.se
Message-ID: <1992Feb14.111329.8312@ericsson.se>
Source record: 112379

I remember I always had a problem loading Synapse Software's Blue Max into my 600XL using a 1010 cassette recorder and an non-pirated tape. The computer was expanded to 64k, the OPTION key was ok, but the loading program kept telling me to "remove cartridge". The 800XL never failed to load Blue Max. Does any owner or ex-owner of the 600XL remember if his (her) machine had (has) this problem too?

After a few months I found out that it could be solved by entering POKE 7,0 at the BASIC prompt and reboot. The loader apparently uses this address to examine if a cartridge is present.

Perhaps it's important to know that my 600XL, I still use it, has a modified self test. The Atari agency decided to translate menu text to Swedish. I have a feeling that Atari generally cared more for their users in the old days. They even tried to help users with Atari Basic programming. Thing will never be the same again.

My mail address is etxansk@garbo.ericsson.se no matter what the article header says.

781. Digi-Studio

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-14 11:13:59 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Feb14.111359.7978@aber.ac.uk>
Source record: 112378

Yes, Digi-Studio plays samples at real musical pitch over a 3 octave range. My earlier works didn't play at real pitch, because of the crummy MC software I was using at the time.

It is a fact of physics that samples speed up as the pitch increases. With the keyboard player of D-S you just hold the key down for as long as you want the note to play for. That way you can also create proper note lengths, like crotchets, semibreves and things (woops! whole notes, 1/2 notes, etc. as you call them in the US). This, in fact, is where we are having problems writing a tune programmer. We have a pretty interface for entering notes, but a 1/2 note at a low pitch plays for a totally different time than one at a high pitch. We are having to write a strange bit of code to get round this, which is really just trial and error! If you played every 2nd or 3rd speaker click, the sound would distort like crazy!

The sound quality of the 8-bit is as good as any computer. I sample sounds using an external A/D convertor, which is far far better than using the crummy capacitor at the back of the pot pins of the joystick port! This is why samples sampled using things like parrot sound so tinny and crap. You wait until you hear Digi-Studio samples, and hear what I mean!

Dean Garraghty. djg0@uk.ac.aber

If it is the patch I saw from GEnie, you need the Happy Disk because
the code INCLUDES part of the Happy code which initiates ultraspeed
mode. It also copies the OS to RAM, which I didn't think was very
cool.

There were 5 Ballsong demos by Doug Crockford, each with different
music. Doug also wrote Galahad and the Holy Grail and Burgers! from
the Atari Program Exchange. Antic put together a disk of a bunch
of his demos around 1987 or so. Did anyone buy this disk, called
"Crockford's Whimsy" I believe?

[Bill mentions another demo]
>It has the Atari Fuji, just like in FujiSpin, but instead of
>spinning, it shows a big, 16 shade robot walking down a hall way, and it

>realistic..), and it played hero-type space music. Anyone seen 'em?

That was Atari's demo from the 1984 CES, at least I think it
was 1984. Very impressive; the programmers did a good job of
hiding the low resolution in the GTIA modes. It's too bad Atari
didn't come up with any *useful* software instead...

785. Items for sale.

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-14 16:33:29 UTC
From: ronh@sunriv.UUCP
Message-ID: <74@sunriv.UUCP>
Source record: 112375

I have the following Atari related items for sale:

2 Indust GT Double Density Disk Drives
one with power supply $60.00
one without power supply $50.00
(requires 12VDC @ 1A - Atari supplies will not
work since they are 12VAC)

1 Atari 1050 Double Density Disk Drive $30.00
(reads but will not write - includes service manual)

2 Atari 850 serial & parallel interface $50.00 each

1 Atari cassette tape deck $20.00

1 MAC 65 assembler/editor cart $ 5.00
1 Atari write cart $ 5.00
(no manual for either :-( )

All of the above stuff worked the last time I tried it
and each includes a power supply and data cable except as
indicated. I have manuals for the Indust drives and for
the 850 interfaces. UPS ground shipping is included. First
response at the listed price gets the unit, otherwise, the
best offer will be taken. First disk drive buyer gets a
box full of diskettes of various DOS's and apps. Please
respond via email as I no longer receive this newsgroup.

|> still around, I think he could give us all some details.

Thanks for the plug, Oscar!

Well that's almost correct...we don't use the cartridge port, we use the
serial bus cable. I have a box that connects up to four cables together
(not all pins connect, notably no +5 volts). One Atari loads the game, and
all others would boot from the master, which acts like the disk at powerup.

I'm still plugging away at the code when I can. I have the little guys
showing up in the other player's 3-D view, and all motion routines work well.
There have been *LOTS* of subtle bugs to overcome...this is far and away
the biggest, most challenging program I've had to work on.

The newsletter editor of the local Atari 8 bit group (P.A.C.E., Pinellas Atari Computer Enthusiasts, Pinellas County, Florida), of which I am a member, is looking for a short article which briefly describes in laymen terms the various file transfer protocols available on the Atari. I.e. Xmodem, Xmodem CRC, Xmodem 1K, Ymodem, Ymodem batch, Fmodem, CIS B, and whatever others may exist. A description of the advantages/disadvantages of each would also be helpful.

If you have a document laying around that may help, or can point me to someplace/someone that does, I'd appreciate it if you would send it my way. I'll even send you a copy of our newsletter (the PACESetter) if you like.

Note that this will be published in our newsletter and may possibly be edited for our purposes.

Thanks for any help.

Hahah! Oh, but wait.. How much mem (you said all of it for 1.5 sec of digi) did a '78 apple II have?

I first heard digi through a stock IBM/Apple speaker a few months back on my friends IBM and it was the "magic mushroom" song. Strange enough that our Chinese friend who gave it to him has a pretty strong accent, but when he sang along, he sounded british! just like the demo! Can a IIe change the volume through software, or at all? Also, can an IBM? :)

My TBXL has a normal clock... it's just the compiled version of a program
using the clock that is fast. The compiler is also in German, but I have
seen posted somewhere (AtariBase?) the english version. I haven't got
around to getting it though...

BTW: Speaking of TBXL and the Compiler.. are ALL the demo.s on Expo91 in
TurboBASIC? I'Ve found at LEAST 2.. :)

> Marek Tomczyk

Have you seen Bros? It plays digi samples during the game, except the game stops for that length of time. If you've seen expo91demo, the last demo (the digi.music) plays with the screen on... or at least a portion, as the entire background is black, and there is a picture in the center. If you've ever used Bob Puff's superunarcer, you'll notice with the "blank screen" option on, the screen is fully blanked EXCEPT 1 status line. This is done with a dli, I suppose, and it DOES run faster. Probably a little less than 30%, but faster. (otherwise, why the option!?)

Also, I made a demo using a digi.picture and digi sound that I stole from an arc of pics, and a sample player demo, and played the sound with the screen on. I just sped the player up by about 2 and it played for the same length, WITH the screen on, but with less quality.

It's easily possible, just leave the screen on (if you're using someone elses routine, e-mail me, and I'll tell you how to fix it up) and play 2wice as fast. Simple Bill

Message-ID: <B6s6FB14w164w@cyberden.uucp>
Source record: 112393

Would somebody be kind enough to explain how to make a good module for
BobTerm that'll let me switch into Trick 320 mode, and take better
control over the screen colors? With trick 320, it's IRG mode 4 (GR.12),
and uses a custom character set (just a set moved 1 bit to the left or
right...) and then sets color regs. 708 (and or 709, depending on how you
converted the cust.char.set), 710, and 712 to one color of differenct
luminences (710 or 712, again depending on the ch.set can be a differenct
color, to make it look like the text is a different color than the
background).. and sets 711, if inverse is used (ONCE again.. depedning on
the chset), to an inverse color. It's very useful for multi-color
graphics, as it doesn't look pixely or blocky, but VERY closely resembles
the normal 320x192 text mode. (I'm pretty proud, as you can tell). One
day I'll upload the demo to the archive.
But..as I was asking.. How could I go about changing the display list to
be in IRG4 mode, and change the char.set.... and also free up 1024 bytes
for the set.. Was that clear? Oh well.. I'll just wait for a
few responses! ;) Bill

Source record: 112401

There's a guy in my town who called me and said I was recommended by a usersgroup/bbs because I was local. This was a while ago, and I was telling him stuff about hooking up his laptop to his 8-bit (both are used, but new to him). Today he called me with trouble with a second drive. He said that he got a NAK error in SpartaDOS, so I said it was probably the cable, but it wasn't because he called later. This time, I told him to check the drive# switch in the window on the back of his drive 2 (both are 1050s). I convinced him to play with MyDOS, as I don't have SpartaDOS, and Atari2.5 isn't very useful most of the time. In the end, he ended up trading drives (must've been a problem with the drive# switch.. like I sort of suspected), so everything worked OK in MyDOS.. BUT.. in SpartaDOS, he gets all sorts of wierd errors (like 139, and 163.. definetly 163.. 139 might've been in MyDOS..) But... I'm wondering how to configure the number of drives under SpartaDOS. He's barely through the manual, and refuses to go on to the next section until he's finished the current.
Is the drive configuration in memory (ie. loc.1802 in DOS2.5) the problem? From what he's said (and I've heard), he selects the directory command, types 2, the drive whirls, and he gets an error. This is with either drive hooked up as 2, so it's no the cables or either drive itself. Any help soon would be VERY useful!!! Thanks... Bill

Message-ID: <1992Feb16.035819.19665@psych.toronto.edu>
Source record: 112399

Fellow Atari 8 bitters:

I have been out of the scene for a while since I was in University. I have recently resurrected the Atari 800 (old 48K machine) and Rana Systems 1000 Double Density Drive (cheap Indus, sort of).

I have a project I'd like to do which involves the transfer of data from my old (heaven forbid) C-64 to the Atari through the joystick ports. I have two old broken joystick cables. Armed with the peripheral interface adapter locations on the 64 and a multimeter I configured joystick port 1 as an output and was able to toggle five lines at will. Now I need to know the peripheral interface adapter memory locations (DDR and Reg itself) for the Atari. A brief descrip of the above locations would help too. Lastly I would like to know how to write a block of memory to a file on disk. I believe that Mapping the Atari listed such informatin for DOS 2.0S (ancient, I realize).

By the way, if I understand correctly, MyDos modifies an existing DOS so that one gets subdirs and Hard disk support. Which original DOS must one ave that MyDos patches? I only have a 'hacked' 2.0S and DOS XL.

Any help would be much appreciated.

I used a "Covox" for years for my demo's on the 8 bit and they work very well to say the leaste. If you can still get I personally would go for the Covox over the Parrot.

There was another simple vioce digitiser (name escapes me at the moment) that consisted of a BC109/148 type transistor, hooked to your joystick port and did a pretty good job. The software was PD and the cost to build it about $3.00 , the hardware was also PD.

Ian maybe if you are reading this you might like to post the curcuit if you still have it in ascii form to this news group (I gave mine away long ago).

I think some of them are binary load files. You could always run WHATIS, or
try loading each one from DOS. I know that P.0 is DOS.SYS, P.1 is the
Turbobasic runtime, and P.2 is the first demo (the one with the snaking text).
For some reason, the second demo wouldn't run on my machine. (800XL with
256K Newell and 256K MIO). I just get a black screen, and a beep. I can
type "LP.4<return>" and see the rest of the demos. I also managed to copy
all the files to ramdisk and run them. Too bad the last one steals the reset
vector. (If you have an MIO and press <Select><Reset> during the last demo,
then press <Reset>, the scrolling text changes to garbage which includes part
of the MIO menu!)

811. Re: TurboBASIC XL

Just in case nobody decided to read my first message about hacking this demo, one of my major questions was were it first originated (inotherwords, who put it on the net, where did they get it..where did THEY get it.. etc. etc.etc.). I'm wondering this, because I don't want to get in trouble for using some of the music (it'll be PD, anyhow.. so I don't THINK they'd mind.. but some people get pretty upset when you borrow things without asking!) So... who in the world first posted this (..and NO, I can't look back in the messages, because this place only stores 50 max, and it's been a while, so it'll have been erased!) thanks in advance; Bill

I just baught an atari 800XL, but it came without a powersupply or video cable. Does anyone know where I could get an 800XL powersupply and a video cable? If you have either and are willing to sell, send me a price.

Doug Mashek
mashek@rtsg.mot.com

814. I need some code...

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-16 21:59:27 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <s0B0FB1w164w@cyberden.uucp>
Source record: 112415

I'm VERY interested in a pseudo-page flipping routine for use in games.
(Of course, I'll note any credit and send a copy to you of any completed
software!) What I need is an interupt (I suppose... I'm very limited in
ML knowledge, but that's what you guys are here for! ;->) that will
continuously change the color register and character set addresses so I
can have more colors on the screen at once. It'll be used in IRG4 and 5
modes, rather than dithering (which I'm VERY against... even thouhg I
have an 8-bit computer!)
So, anyone that good? (hehe..) I would try using a DLI (which I have a
LITTLE bit of experience with fiddling with), but I still need to figure
out how to shut it off before I change the pointers at 512 & 513 (it
usually just crashes!). I recall reading something about that.. I forget
where, and I don't think it went very deep in explaining. So...
Please respond ASAP!
Bill

> he's finished the current.

SpartaDOS-X recognizes all drives by default on boot-up. Is this disk-based
SpartaDOS? If so, then I'm not sure. The fact that the drive actually
SPINS, though would indicate that DOS is at least talking to the drive. Can
he read/write with MyDOS? What kind of drives are these? SpartaDOS may be
trying to talk to the drive at high-speed and his SIO connection is so weak
that it is causing read/write errors in that mode ...

To: Hussein!

In a msg of <16 Feb 92>, Hussein Rajput writes to All:

HR> (From: hussein@psych.toronto.edu (Hussein Rajput))
HR> (Organization: University of Waterloo)

HR> Fellow Atari 8 bitters:

HR> lines at will. Now I need to know the peripheral interface adapter
HR> memory locations (DDR and Reg itself) for the Atari. A brief descrip

PIA: 6520 CHIP
54016-54271 D300-D3FF

The Peripheral Interface adapter (PIA) integrated circuit is a
special microprocessor used to control the atari ports, controller
jacks one to four. Ports can be used for both input and output
simultaneously or alternately. Barely tapped at the time of this
writing, the ports represent a major resource for external (and
internal) control and expansion. PIA also processes two of the IRQ
interrupts; VINTER and VPRCED, vectored at locations 514 to 517
($202 to $205). These interrupts are unused by the OS, but also
may be used to provide greater control over external devices.

54016 d300 porta

(w/r) Reads or writes data from controller jacks one and two if BIT
2 of PACTL (location 54018) is one. Writes to direction control if
bit 2 of pactl is zero.
Thes two port registers also control the direction of data flow to
the port, if the controller register (54018, below) is poked with 48
($30). Then, if the bits in the register read zero, it is an input (R)
mode; if they read one, it is in output (W) mode. A zero POKED
here makes all bits input, a 255 makes all bits output. BIT's 0
to 3 address pins one to four on jack one, BITs 4 to 7 address pins
one to four on jack two. Poke 54018 with 52 to make this location
into a data register again. Shadow registers are: STICK0(632;
$278, jack one), stick1(633; $279, jack two) and ptrig0-3
(636-639; $27c-$27f).

bits used as data register
7 6 5 4 3 2 1 0
-jack0- -jack 1 -
-stick 1- -stick 0-
Forward = bit 0,4 = 1

Backward = bit 1,5 = 1
Left = bit 2,6 =1
right = bit 3,7 =1
neutral = all four jack bits = 1

porta is also used to test if the paddle 0-3 triggers (PTRIG) have
been pressed, using these bits:

7 6 5 4 3 2 1 0
PTRIG 3 2 - - 1 0 - -

Where zero in the appropriate bit equals trigger pressed, one
equals trigger not pressed.
The PORT registers are also used in the keyboard controller (used
with a keypad) operation where:

Bit 7 6 5 4 3 2 1 0
row 4 3 2 top 4 3 2 top
jack ....2....... ....1........

Columns for the keyboard operations are read through the POT
(PADDL) and TRIG registers.

54017 d301 portb
(w/r) prot b. Reads or writes data to and/or from jacks three and
four. Same as PORTA, above, for the respective jacks. Shadow
registers are: STICK2(634; $27a, jack three), stick3(635,$27b,
jack four), and ptrig4-7(640-643;$280-$283).

54018 d302 pactl
(w/r) prot a controller (see 54016 above). POKE with 60 ($3c) to
turn the cassette motor off, POKE with 52 to turn it on. You can put
a music cassette in your program recorder, press PLAY and then
POKE 54018, 52. Your music will play through the TV speaker or
external amplifier while you work at the ATARI. You can use this
technique to add voice tracks to your programs. To turn off
the music or voice, type POKE 54018,60
PACTL can be used for other external applications by the user. Bit
use is aas follows:

Bit Function
7(rd only) Peripheria A interrupt (IRQ) status bit. Set by
peripheral (PORT) A. Reset by reading PORTA
(53774; $d20e).
6 set to zero
5 set to 1
4 set to 1
3(write) peripheral motor control line (turn the cas on or off) 0=on
2(write) controls PORTA addressing. One equals porta register; zero
equals direction control register.
1 set to zero.
0(write) Peripheral A interrupt (IRQ) enable. One equals enable.
Set by the OS but available to the user; reset on pwr up.

54019 d303 pbctl
(w/r)Port B controller. Initialized to 60 ($3c) by the OS IRQ
code. PBCTL is the same as PACTL, above, with the following
exception (this may actually perform the same function as in
PACTL, but I am not sure of the distinction between descriptions:

bit Function
3 Peripheral command identification (serial bus command),
initialized to 60 ($3c).

Ports can be used for external control applications by the
technically minded reader who is willing to do some soldering to
develop cables and connectors. A good example can be found in
COMPUTE, February 1981, where the author gives directions for
using jacks three and four as a printer port. The Macrotronic
printer cables use just this method, bypassing the 850 interface
entirely (one way of reducing your hadrare costs). Theoretically,
the entire atari can be controlled through the ports.

****
Locations 54020 to 54271 ($d304 to $3ff) are repeats of locations
54016 to 54019 ($d300 to d303).-

HR> of the above locations would help too. Lastly I would like to know how
HR> to write a block of memory to a file on disk. I believe that Mapping
HR> the Atari listed such informatin for DOS 2.0S (ancient, I realize).

to write a block of info from memory, you set the address of where to
write from and jump to CIO. What language are you using??
You also have to indicate the length you wish to write.

HR> Any help would be much appreciated.

Not brief, but hopefully helpful.

```
Solution: don't send 8-bit stuff to the main moderator of atari.archive.
Instead, send them to John Dunning, who maintains the /8bit hierarchy of
atari.archive. Jrd's address is jrd@stony-brook.scrc.symbolics.com.

I believe this is stated in the FAQ.

Are you sure?

The memory access time to any memory location should be the same from
valid address to data latched. The advantage of page zero RAM is that
intructions using zero page addressing need only specify the lower 8
bits of an address thus saving a memory read cycle on the opcode (
that is address of operand) fetch. The processor assumes the upper
byte to be 00H, hence page zero. Some upgrades offer a movable "page
zero." That is the upper 8 bits can be set to any page in memory.

They had the original game set up for 4 or 5 sequels/add ins, but DataSoft went south so they only got the 1st one out for Mac, 8-bit, IBM, & ST & the second only for the 8-bit (I think?). I read a thread on CI$ where the DataSoft people were slightly critical of Price's coding because it was so hard to follow & saying that The Dungeon was a complete rewrite that was designed to more adaptable. They said they spent $250,000 developing The Dungeon so it's little wonder they went under. I've got a list of sequels somewhere, but I guess it isn't important since we will never see them.

827. Re: Some Xformer queries....

Newsgroup: comp.sys.atari.8bit

I've used Xformer & although I consider it an amazing programming feat it's. some what of a novelty. It doesn't support some graphics modes like 12 or 13 & doesn't really run as fast a real XE. DLI's aren't supported either so most commercial programs that take advantage of the features/graphics modes won't work. It is nice to have several virtual disk drives on a single ST disk, but even basic runs so slow it makes program development so slow it hurts. It works with both a 810 or 1050 & I imagine a XF551, but they aren't necessary. I'd advise just using the ST W/O building the cable & see if it does anything you need. If you find out you still want it, let me know & I'll get you a pin-out.

Jeff,

regarding to the storage formats of 4 bit resolution I can tell
you from what I've encountered so far that there are at least two
common formats: first one stores data in a serial way. That means
the first code is stored into the low nibble of the byte the second
one into the upper nibble. Than the third is again stored into the
low nibble of the following byte and so on....
There's another format I know of: first the half of the _whole_
digitized data is all stored into the lower nibble of a byte and
than _the other half_ of the data is stored into the upper nibbles
of bytes you used for the first part.

833. Apple .. Emulation?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-18 02:14:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-02-17-18:14:54.79*UJ1G"@DKAUNI2.BITNET>
Source record: 112421

Steve,

few months ago one guy wanted to throw out his old APPLE II +
compatible computer. I told him to give it to me. Now I have this
old fellow in my room. I got some manuals for it, and thought of
exchanging software in a way. But it isn't that easy. It's BASIC
may seem similar to my familiar ATARI-BASIC but if you want to
transfere programs in machine language you have to emulate the whole
system. You can say it _is_ different. Especially the file system.
It needs a special controler which stores the data in a very APPLE
specific way. You have to emulate the whole hardware beginning with
paddle control and ended with it's stupid sound module not talking
about it's funny graphics memory organization.

It is possible to emulate an atari ST on the Amiga because of it's
huge memory and especially because of it's CPU speed.
The emulator would probably use some remarkable amount of RAM
leaving only a few bits for the APPLE program.
As somebody stated already it would be better to spend some time
on writing sophisticated software on the ATARI instead of wasting
time in transfering APPLE programes to atari.
Everythig that can be programmed on an APPLE can be programmed even
better on the ATARI.

834. What are .atr files?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-18 03:09:16 UTC
From: hussein@psych.toronto.edu
Message-ID: <1992Feb18.030916.9249@psych.toronto.edu>
Source record: 112419

Hi,

I've just resurrected my original 800 and Rana 1000 drive.

Tell me, what are .atr files and what applications use them/
how does one create them/use them?

I understand there is a file on atari.archive.umich.edu that talks about
expanding mem on the 8bits...including my old 800. Am I missing out on
anything by only having an 800? If so, is it worth upgrading it or
should I buy an XL or XE? Lastly, what are some of the nifty
upgrades out there?

I'm sending from my friend's U of T account again.

I'm mmmei@sunee

835. Newell upgrades -- what's the difference?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-18 03:14:00 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <698392822.F00001@tdkt.kksys.com>
Source record: 112422

THE MAJOR DIFFERENCE I SEE BETWEEN THE 256 AND 1 MEG UPGRADES IS THAT WITH THE 1 MEG UPGRADE I HAVE INSTALLED in the XL, you will loose the internal basic, and you must use a cart. The way my upgrade was installed, all I have to do is install some different chips, and it's up to 4 megs. This was an option that the installer chose to do just in case I decided to expand further. Other than that, all files that I've attempted to run on it have run. I primarlly use it to run Warp 10, but sunce I'm in the process of moving, the bbs is not online, but will return. This has given me a chance to play around with it. In running Warp 10 with the 1 meg XL, I'm using it with SpartaDOS 3.2d. There are a few files that won't load or run under this version of SpartaDOS that do run very well using SpartaDOS X 4.20

As for the upgrade itself, just be sure you know what your doing for it is a somewhat involved process, but not too bad.

Has anyone seen this TV show? And would anyone be interested in a game?
(I started one a while back.. when I wasn't as good a programmer as now..
much stuff from the 70s is better!!!)
Also, does anyone have any pics (digi or otherwise) of any of the
characters? (The Count, Igor, Nanny, The Crows, von Gooswing, The
Pirates..) The show is currently on Nickelodeon at 8:30am (I think)
(Pacific) on Saturdays and Sundays. It was a spin-off of Danger Mouse.
Both were created by Thames productions.. and at least Duckula was made
along with Nick. BTW: Any UK'ers.. is this show still being made!?
I'm a VERY big fan!!!!! thanks... curiously.. Bill
(the 18th Count!)

bmarcum@world.std.com (Bill Marcum) writes:

> Oh, I forgot: The directory of the demo disk is patched to give every file
> a length of zero, but you can copy the files using Mydos.

I'm still wondering if they'd be THAT upset if I stole P.10 for my own
uses!? I LOVE that music.. it'd probably be best for my Klix (klax
clone, if you didn't guess) title screen.. (it can handle the P.9
routine for the bobbing blue bar and all those other DLI effects on the
first demo.. so it can handle my pretty title screen!)
If you wish... here's how it works (if you're no such a hacker as most
anymore!) BRUN"D:P.10" from TurboBASIC, and then ?USR(44032).. it starts
the music, and sends and ERROR 9... I'm not sure how to overcome it other
than a TRAP... To end it, POKE the following #s to, say page 6 (1536+),
or stick it in a string, and call ADR(whatever$) instead of 1536 or
whatever..:
104,160,98,162,228,169,7,32,92,228,169,6,160,95,162,228,32,92,228,96

P.8 is the POKEY screen for the first demo (minus the credits and
Megagrettinx).. it aslo contains a "backup" char set, I suppose... for
the rotated set in memory used for the squares... (all rotated stuff
needs a good buffer!)

P.7 is the original char set for the 1st demo.. this is just a char set
with a bunch of chars shaped like bits of squares.. (if you have a 1200xl
or a F-key upgrade, hit CTL+F4 and you'll notice that the POKEY doesn't
change, and loc.756 (chset pointer) doens't, so the chset is just MOVEd
around...)

P.9 is the bouncing red and blue of the first demo (use USR(24576).. just
a GR.0 to end.. can even be used on graphics screens!)

BRUN"D:P.16" for the "Yeah" "Comtech Crew" demo (>I< thought it was TBXL,
but it IS ML... not that difficult to do in TBXL, tho.. I've make a
snake-line routine that can be upgraded to handle that type of movement
and sprites..)
all the rest has yet to be figured out (at least by me!)
keep hack'n! Bill

What are you trying to hook it up to? A monitor? A TV? What type of
input do they take? You can pretty easily get a cable between
"switchbox" and a switchbox or composite. You can get a monitor cable
from B&C ComputerVisions, and perHAPS San Jose Computer...

Their addresses/ph#s are:

B&CComputerVisions:
2730 Scott Blvd
Santa Clara, CA 95050 (USA)
1-408-986-9960

San Jose Computer
1278 Alma Court
San Jose, CA 95112 (USA)
customer servc: 1-408-995-5080
ordering: 1-800-726-8576 (might be disconnected??..try anyways..)

Bill Kendrick

BTW: Also ask about BEST computers.
PS: At least San Jose has power plugs... not sure about B&C or BEST.

> I may have this on disk somewhere, bundled with a somewhat
> likeable "Stairway to Heaven" song...

It's been a while since I played around with AMS, but all the players I
remember had a piano keyboard style graphics.

I think that you are describing the Antic Music Processor (AMP) that was
first published in Antic in Dec. 1988 (if memory serves correctly). The
latest version (2.1) was published in the June 1989 issue. I seem to recall
a minor updated version on the August 1989 Antic disk. I could be wrong
about that though. I do know that Ver. 2.1 gave you the ability to add
lyrics to the screen like the first demo song that was on the Antic disk.
That song was 'Sail Away' or 'Sailing' by Christifer Cross. (?)
It was (and is) a very good song editor and player. It's only drawback
was that there was no way to put it into a cycle mode and play all the .AMP
songs on a disk. It even had a converter program that converted .AMS files
to .AMP. My son has just finished entering the Beatles 'Imagine' and he
now expects me to add the lyrics. Time to dig out the instructions again!

This may be old news as you read this because I am about 100 articles
behind, but I knew if I didn't comment now, I wasn't going to go back
and try to find the article later. Experience, if nothing else, is a
harsh teacher. :-)

If you are into music on the 8bit Atari, you need this program in you
library. I wish I could find as good an editor for the MS-DOS machines.
One word of caution: It doesn't use notes like EA 'Music Construction Set.'
It is much more editor oriented.

848. 130XE vs 800XL (use of tape recorder)

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-18 13:19:05 UTC
From: etxansk@garbo232.ericsson.se
Message-ID: <1992Feb18.131905.11013@ericsson.se>
Source record: 112342

Atari have changed the look of their tape recorders for the 800/XL/XE line a few times in history. The last model is grey and called XC-something. XC12?

It does not have its own power supply but uses the computer as a power source via the I/O-cable.

Can this XC12 recorder be used with older (800, XL) computers or are they unable to support it with power?

I know it works fine with my 600XL generally, but sometimes the 1050 diskdrive fails to read if I rewind a tape simultaneously. When this occurs one can judge by the sound of the devices that there is a slowdown in an electric motor.

My mail address is etxansk@garbo.ericsson.se no matter what the article header says.

BTW: Have you got your Action! cart yet? If you can be a little more specific about what you want to do I could probably get it done. You have to tell me (or anyone else for that matter) what your display will look like i.e. 3 graphics(0) lines followed by 8 gr.(12) with colors [v,w,x,y,z] etc. If you're having trouble designing gr.(12) character sets there's a utility floating around (SCRNEDIT.ARC) that'll import the first 24 scan lines of a MicroPainter picture & convert it to a character set.

851. AMP / Price @ Gilbertson

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-18 18:27:27 UTC
From: markjl@bu-it.bu.edu
Message-ID: <1992Feb18.132727@bu-it.bu.edu>
Source record: 112430

Hello everybody! (My first post here)

AMP was called the Advanced Music Processor and was created by Phillip Price and Gary Gilbertson (they went on to program Alternate Reality for Datasoft or Datamost which was bought up by Intellcreations and then disappeared after releasing AR: The City).

Perhaps Antic bought rights to AMP and renamed it, but I have one PD file called
"Passionately" which was great: it had the music bars for all four voices showing
volume and pitch as well as overlying highlighted lyrics.

A few years ago, Atari8 on CompuServe got in touch with Price and Gilbertson
and they posted a disk full of other demos/outakes from AR/AMP songs. Nothing
was greatly polished, but it was worth getting to get some more from this duo.

They had thought of making a Christmas disk, but I don't think that ever came
about.

I'd post the files, but I'm away from my Atari 8bit at home. IN any case, I'd
welcome follow up comments/replies because these were some of my favorite songs
and I'd love to see anything else these programmers did (actually Price program-
med, Gilbertson came up with music and lyrics).

That's my answer to the mystery! - markjl@buengf.bu.edu

Not that this has anything to do with comp.sys.atari.8-bit except maybe
the game idea, but check out the first line in my .sig! I love that show!

CC: POEHLAND
Subj: MAIL SURVEY CAMPAIGN GOES INTERNATIONAL

Although Jeff McWilliams' press release announcing the launch of a write-in campaign for Atari Classics initially stated the Campaign would be limited to USA residents only, he has received a number of responses from interested parties residing outside the US.

After some palaver & headscratching over this, we decided it would be within the capacity of our <limited> resources to make a modest expansion of the Campaign into the global arena.

Individual mailings to non-USA addresses will start going out this week, with highest priority given to Canadian addresses. Info-Kits sent to foreign participants will be essentially identical to those furnished domestic participants. The only difference will be a slight modification of the means of returning the postcard form; it must be mailed in a small envelope (furnished in the Kit) to our USA mail drop address. The participant will need to affix the postage required by his/her country to the USA. Upon arrival at the mail drop, the card will mailed to Jeff in the normal manner via US Mail. This is more expensive- both for us & the participant- & is a bit more clumsy, but it will permit foreign participation without compromising the format we have established for validation & ease of handling the large volume of data this Campaign is generating.

A special information note, containing detailed instructions for non-USA residents, will be included (along with the preaddressed small envelope containing the return card) in all Info-Kits sent outside the USA.

So..... you folks in Canada, UK, NZ, Down Undah, & anywhere else English (or some variant thereof!) is spoken, this is your chance! You have spoken, & we have heard you!!

Send your name/mailing address to:

Jeff McWilliams
INTERNET: jjmcwill@mtus5.mtu.edu
GEnie: J.MCWILLIAM3

Thank you all for your interest & enthusiasm! Response so far has been very gratifying. Despite stepping up weekly production of Info-Kits, I'm having a tough time keeping up with the demand <GRIN!!!>.

854. INTERNATIONAL CAMPAIGN: UPDATE

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-18 20:01:47 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9202182001.AA15437@smithkline.com>
Source record: 112443

Approximately 25 Campaign Info-Kits have been sent out to addresses all
over the world, about 3/4 of them to Canada.
We even have received one positive international response already, from a
Canadian who wants to be a regular columnist for Atari Classics!
I tell yah, stuff like this is enough to warm the heart of the most crusty
alchemist!

Once again, all you guys out there in Canada, UK, New Zealand, Australia,
South America, Europe, North/South Pole, Equator, & every place in between
(did I cover everybody?), let's get those names/addresses in to Jeff McWilliams!
No mail delivery to your locale? No problem! We got dogsleds, rowboats,
parachute jumpers standing by.....

CC: /PN=COLIN.W.HUNT/O=SPRINTINTL/ADMD=TMAILUK/C=GB/@sprint.com
Subj: Where's My Mail Going!!!!

Hi Ben,
How are you? Hows the house repair going?

I was wondering if you could help. Theres been a lot of talk on IA8 that I've tried to respond to, but my messages just dissapear! I'm I using the correct addresses:

(c:usa, a:telemail, p:internet,id:<comp-sys-atari-8bit(a)ucbvax.berkeley.edu>)

or

(c:usa, a:telemail, p:internet,id:<info-atari8(a)naucse.cse.nau.edu>)

My system crashed on me several weeks ago and I lost my 'abbrev' file. Pls post response via IA8, as I still seem to be rxing, even though it arrives in bundles!!!

For your (and everyone elses) interested, I have the following news:

* DataQue are going to distribute 8:16 within the USA for the BaPAUG. Finally arrangements have still to be completed, though we have both aggreed to give it ago.

* In response to the request for an RS232 interface, Gralin International already provide one. It plugs into the SIO port and comes complete with some comms software. We are currently writing an R: handler for it.

* Gralin has also started production of the REPLAY sound sampling cartridge (originally supplied by 2-bit systems - the people who design the REPLAY cartridges for the ST and Amiga). The UK price is 34.95 pounds.

* Finally, Gralin also have a MIDI SIO cable allowing the 8-bit to control MIDI compatible musical instruments, Percussion Master, which is a hardware box that plugs into both joystick ports and software. The hardware contains a D-A convertor, and the software allows you to use REPLAY samples. Sound quality is far better than using the internal sound system - this normally allows a 4-bit resolution, whereas with the added hardware there is 7-bit resolution. Last, we have a product called Digidrum, that also uses REPLAY sample, but via the internal sound system (by the way, this is currently being modified to support the POKEY

stereo upgrade). The UK proces for the above are:

MIDI Master - 29.99 pounds
Percussion Master - 24.95 pounds
DigiDrum - 5.99 pounds

If you wish, please post the above to anyone that may be interested - all my attempts to do so have failed!

Regards
Colin Hunt

//

Despite recent upgrades to hardware at my site, it still appears my coms to Colin are vanishing into the aether; not even so much as a bounce-msg from the MAILER-DAEMON, whatever that is......

Anyway, the products from Gralin Int'l look very interesting, & if DataQue will be distributing those in North America, it will be a most welcome addition to the market here. BTW, the exchange rate between the British pound & the US dollar is roughly US $1.70 to the pound, for you folks who'd like to get an idea of the American prices. Canadian exchange is roughly US $1.00 to about $1.25 Canadian.

I am less thrilled at the possibility of 8:16 entering the North American market to the degree suggested by plans now being formed by BaPAUG/DataQue. As most folks on this Net are aware, I recently rejected a potentially lucrative offer from Explorer Magazine to extend their 8bit coverage by the inclusion of Atari Classics therein. As I explained in IA8 #42 (11FEB92), a major reason I did so was to thwart the entry of Explorer into our already fractionated market. Explorer has essentially no 8bit coverage, & for the sake of the 8bit community here I am content to see it stay that way. The 8bit user community here is already split between AIM & CN, at a combined price no one can afford for total coverage that is inferior to what ANTIC gave us at lower cost. Both AIM & CN suffer the problem of diluted 8bit coverage that has to compete for page space with the ST/TT/Lynx/Portfolio/2600/ABC products- much to ANNOYANCE of just about every 8bitter I know.

The entry of 8:16 into the American market would accomplish the damage I successfuly prevented Explorer from doing: giving the 8bit community yet another bimonthly magazine with diluted 8bit coverage, contributing to the very process of fractionation/diilution that Jeff McWilliam's mail survey campaign is trying to fight.

Colin Hunt is probably unaware of this, but Chuck Steinman should know better. DataQue is thus far the only 8bit vendor who has rejected the invitation to join the Atari Classics campaign. It pains me greatly to say this, but I can withold my feelings no longer: Mr. Steinman is clearly placing his own personal agenda before considerations of the health of the community in general. It is my personal opinion that he is taking advantage of Colin's lack of familiarity with conditions here to further his own ends. I hope this will not be interpreted as a personal attack upon anyone; it is just my particular view of

things as one whose primary interest is the health & welfare of the 8bit community in general, & who has spurned any oppurtunity for personal profit in the pursuit of that principle.

I have said this before, & I say say it again now: the 8bit community has contracted to the point where 2 magazines are one too many. Our resources need to be CONCENTRATED, brought back into realistic balance with the realities of the market, if that market is to survive. Such concentration will regrettably reduce the diversity we now possess- but which is also killing the market. Only by re-focusing our resources, re-establishing the single unifying forum of communication we once had, can we hope to solidify the present situation & create a foundation upon which to <hopefully> re-build the market to the point where it can once again support a diversity of publications. We start by taking the single largest chunk of that market- which AIM now possesses but is serving poorly- & build Atari Classics upon that with the assistance/blessing of the publishers of AIM. It is even possible some type of link could be forged between AC & CN, to shore up the foundation of the stucture we so desperately need right now. The new 8bit Editor of CN has come out strongly in support of Jeff's mail survey campaign, & for my part I am giving the new Editor my personal support & assistance to get him over the startup hump.

I personally would be saddened to see 8:16 become Americanized. One of the more delightful aspects of 8:16 is its unique British flavor. British products, & British views of things, always seem to have an interesting twist we don't often see on this side of the Atlantic. I'd hate to see that sparkling quality get washed out of 8:16.

Colin, I implore you to seriously consider the potential impact upon the market here of the venture you are now considering with 8:16. I do not know if it would be feasible for 8:16 to establish some arrangement with Atari Classics. But at the very least, you have nothing to lose by contacting Jeff McWilliams & exploring those possibilities, before you finalize an arrangement that will almost surely contribute to the dissolution of the very market you are trying to support.

Since January Jeff & I have put HUNDREDS of hours of work- & I have to date donated in excess of $500 from my own pocket- into the mail survey campaign which is this week going global (yes, Colin, an Info-Kit is on its way to you at this very moment). We would not be doing this, if we did not sincerely believe in the validity of our cause. At least think about it, hey?

Source record: 112426

Michael Mei needs some information about the PIA memory locations.

There are two essential locations one should know wanting to initialize
the joystickports for output and/or for input.

PORTA 54016 ($D300)
PACTL 54018 ($D302)

PORTA has two functions. It serves both as data register of the PIA
and as the data direction register depending on the value of bit B2 at
the location PACTL

PACTL 54018 ($D302)

```
_____________________________________
| B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
-------------------------------------
/\
||
```

If you want to 'talk' to the DDR you should set B2 to 0 (zero).

Now you can store your initialization value to the DDR which now can
be found at the location:

PORTA 54016 ($D300)

```
__________________ ___________________
| B7 | B6 | B5 | B4 | | B3 | B2 | B1 | B0 |
------------------ -------------------
```

(port 2) (port 1)

where bits B0,B1,B2,B3 correspond to the lines 1,2,3,4 of the
joystickport 1 (looking at your computer on your left hand side)
and where bits B4,B5,B6,B7 correspond to the lines 1,2,3,4 of the
joystickport 2.

Every bit set to 0 (zero) initialize the corresponding line as input,
every bit set to 1 initialize the line as output.

After setting up the DDR you have to unselect it by changing
B2 of PACTL to 1 again. Now you can store and receive data through
PORTA depending on how you did set up the lines.

WARNING: You should unplug the joystick when you try to configurate
the PIA to _output_. Playing around with it could result
in damaging of the PIA.

> Please respond ASAP!
> Bill
here it comes:

you need the location NMIEN 54286 ($D40E)
to disable the DLI simply set the bit nr. 7 to 0. The bit nr. 6 serves
for the control of the VBLANK interrupt.
The most simple way for doing it is to type POKE 54286,0. Then both
the DLI and the VBI are off. When you want to turn the DLI on
type POKE 54286,128. (VBI: POKE 54286,64 ; VBI & DLI : POKE 54286,192)

Yep! I just happened to notice him on the Fidonet (That OTHER Net) in the
atari 8 bit echo. I dunno if he has INTERNET access but It seems that I
would be able to "capture" messages here and be able to send them to him via
the public echo on Fido if anyone has the need.
He has asked for article submissions and any atari 8 bit info anyone would
like to pass along..
It was great seeing him on the fidonet, and im sure that Ill be taking time
out to write him. I enjoy his postings a lot.

you on delphi? Write ASGARDIAN.. That's me!
Maybe we can swap stuff.
Delphis 8 bit area is kinda lean.
No new stuff lately.. especially in the way of PD bbs programs.
Do you happen to have Oasis Test drive?

Anyways, I thought there was a newer version of apac?.. maybe I read
something wrong or got the version number mixed up with colorview.

> just as useful & productive a piece of machinery as any other peripheral.

I was being "toungue in cheek". guess that doesnt come out well on
newsgroups.. The 1027 isnt a good printer, but i guess that it does have its
usefulness.. I have gone through 2 of them though and completely under
normal use conditions.. The 1027 really is not a "quality" made product, but
it is letter quality and does a decent job of printing things.
The problems I encountered with the model were numerous however, and based
on that standpoint, I could not encourage people here to buy, own or use
this printer as a reliable, problem free peripheral.. I didnt read the
article about it.. But even so, id rather take this nice panasonic I
replaced it with.. No more noise, no more paper jams, no more bent silver
paper guides, no more problems with cotton bond paper, no more tough to find
ribbons, no more difficulty in using computer paper reams, etc..etc.
Its also pretty slow.
Again this is my personal experience with the 2 1027's I have here.
A further factor worth mentioning is that a power supply replacement for
this thing is sold by the dealers for A GOOD PRICE!
I think I was seeing it around $30 a year or so ago.. probably arond that
now.. I havent seen it cheaper than $25..
Im really down on the 1027 printer.

What did your article say that would convince me that its worth
keeping the broken ones I have here?

The XC12 works with the 400 and 800 as well. The problem is, the 400/800's power supplies are not very strong, and turning the XC12 on (when it's loading or rewinding, etc.) can crash the computer. I used one with a 400 and it blew the power board. The XC12 is pathetic as a datarecorder. I get far more errors with them than the good ol 1010s.

Ian Chadwick just never got around to document the PIA chip properly.
There is much more to this chip, hidden in those PACTL/PBCTL bits
that are 'set to zero or 1'. There is for example a feature like
this, that you can create a strobe on one control line
with just one POKE to PORTA, and much more. It pays to get the real
documentation for the PIA.

868. Problems with Das_Omen and Expo91 demos

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-19 13:35:46 UTC
From: fontana@cis.ohio-state.edu
Message-ID: <1992Feb19.133546.4083@cis.ohio-state.edu>
Source record: 112306

Ok, with all the talk about these demos, I'd like to check them out.
I got the appropriate .dcm files and uncompressed them using Disk
Communicator. (Das Omen to a 92k disk, Expo91 to a 143k disk).
Both uncompressed fine with no errors. I changed the max. sector for the
Das Omen demo to a high value, ~2000, before uncompressing. I'm aware
of the extra 'b' in the posting of Expo91; I also tried .dcm files from
atari.archive. The file size that uncompressed with no errors was 90752
bytes.

But when I try and boot the final disks, I get the following results:

Das Omen: less than 10 beeps, the locks up with a black screen and the
text "A: DAS OMEN".

Expo91: Loads for a few seconds, then screen turns black and locks up.

I'm trying to run these on a stock 800, connected using the SIO2PC interface.
Installed memory is 48K. I've tried running them with and without the BASIC
cartridge.

Anyone know what could be wrong? Will these demos even work on an 800, or
is an XE required? I got the "awesome" demo recently and had no problems
with it.

Thanks,

Mark Fontana

869. SpartaDOS & 2 drive

Newsgroup: comp.sys.atari.8bit

I'd suggest trying to see if the disk based SpartaDOS can be booted from both drives. Personally as a safety measure I ALWAYS turn off the drives (floppies) when switching drives. Also (this is a BIGGIE!) don't unplug the I/O cables from ANY 1050 with the power supply cord plugged into the 1050! There is a chip in the 1050 that will go bad if a 1050 owner continues to do this. I got this tip from a EXPERT Atari hardware repair person in the area. He's good enough to modify things that even ICD stated couldn't be modified! Spcifically, he modified a 256k mio to 1 meg and ICD stated that it just could not be done. He sat down and drew out all of the drawings and did the modifications himself. He has also worked on 100's of different pieces of Atari hardware and drives and even did my 1 meg XL. After he did the XL, he thought of a better way to do it!

Anyway back to the drives, nothing was mentioned if either drive has the ability to format. After cleaning the drive heads, try to see if the drive can read the floppy. If not, see if the drive can format. If not, it's the controller chip.

I know the Expo91 demo requires an XL/XE. I'm not sure about Das Omen,
although I assume it does as well. When you get the black screen in Das
Omen, press 'A' (it's actually a menu - this confused me for a while as
well...)

If you need a tape recorder, go for the XC12. It's much better than
the 1010 in that it doesn't chew up tape all the time.

I'm not convinced that the XC12 (or any Atari tape recorder that looks
more like the XE series) was designed to be used with pre-XE equipment.
I use an expanded 600XL together with a XC12, 1050 and more, and it works
just fine.

My mail address is etxansk@garbo.ericsson.se no matter what the article

The "A:DAS OMEN" means press A to load DAS OMEN.

They just used a binary file loader type menu instead of having the
demo completely boot and execute.

Hello There!!! I just got my 800 out of storage, and I would like to start using it for my personal use at home!! Does anybody know of a good checking program like "Home Accountant", or something similar? I would like a commercially made program, or a very good shareware program. I'm willing to pay for a good one!!!

Also, I have the ATR8000... What does it do? can I use the RS232 port to hook-up a modem? If so, what kind of cable do I need?
As you can see. I'm new to this... Any advice??? Thanx in advance /Mark

876. SIO2PC - Version 3.01 Notes

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-19 23:57:48 UTC
From: omf@jab.tucson.az.us
Message-ID: <2q2egB1w164w@jab.tucson.az.us>
Source record: 112316

SIO2PC REV 3.01 NOTES

It's time to describe rev 3.01 already - pretty fast on the heels of
rev 3.00. Many of the changes were made to fix bugs in rev 3.00, but
there also are some substantial new additions.

THE BUG FIXES:

Rev. 3.1: Fixed PUT_SECNO so it doesn't unless cmnd is P, W, or R.
Added JMP RED1 after CALL GET_CONFIG. Previously, it went to U13
which updated the status line, taking too much time. In READ_DSK,
added the line to change DSK_FLAGS when the LOAD_OPT is /N.
Now the "don't format physical disk" option DOES work. On
the QUICKA version, I changed the IF NOT ONECHIP to IFE ONECHIP
after I realized that NOT does an EOR, so a non zero number still
ends up non zero unless it were all 1's to start with. This had
been causing major problems with the ONECHIP version. Changed the
CUSTOM message to say 65535 sectors max instead of 16535. Fixed the
number of characters to be input for disk size from 5 to 6 because
the CR counts as one. Previously, one could only go with 4 digits
maximum. Corrected the math which converted the number of sectors
to the size in paragraphs. There was an error for LARGE disks
because I was failing to left shift the high word for each "times 2"
operation. Fixed the PUT_DEVID routine, because it wouldn't - in
some cases.

THE NEW STUFF:

ULTRA SPEED I/O!!!! I don't have all the difficulties worked out yet,
but it is working. The bit rates available on the Atari don't exactly
match those available on the PC, so I had to pick a rate where they were
practically the same: 38 KB. This isn't as fast as the US Doubler can
go, but it IS twice as fast as SIO2PC usually goes. A few cautions
are in order. I couldn't fully understand all the stuff SPARTA DOS is
doing. It goes to high speed, then back to regular, and again to high.
I get lost somewhere in the middle as to what is the signal to go back
to high speed. As a patch, I put in the "J" command, for Jump to Ultra-
speed. It actully toggles between the two speeds. (There's also a new
field on the status line for speed: "N" for normal, "H" for High.)
Anyway, after booting Sparta Dos, you will probably need to punch a "J"
to get back to high speed. We'll find other complications as we go
along. For instance, trying to mix high speed stuff with functions which
work in regular speed (PRINT_THRU, REMOTE, FILE2PC) will probably
cause problems. Should probably limit the high speed stuff to loading,
saving, and copying files. But that's most of what we do anyway, right?

MORE DISK CONFIGURABILITY:

I've heard lots of reports about the inability to format certain disk image sizes. My adding the "get configuration" and "send configuration" functions in Rev 3.00 in some cases seemed to make matters worse.

I'm now getting into an area where the specific DOS one uses makes a difference. So my treasured concept of "DOS independence" of SIO2PC is going out the window. The problem is this: How can the system tell the Atari exactly what size and type of disk it is emulating? The 12 byte configuration table exchanged via the GET/SEND CONFIGURATION commands would seem to be the answer. Unfortunately, both MYDOS and SPARTADOS admit to ignoring most of the information exchanged. The variables are:

SINGLE/DOUBLE DENSITY: 128 or 256 bytes/sector
SINGLE/DOUBLE SIDED DISK
NUMBER OF TRACKS/SIDE: TYP: 35, 40, 77, 80 expected
NUMBER OF SECTORS/TRACK: TYP: 18 or 28 expected

The MYDOS doc indicates that it likes to consider the disk to be one huge track containing all the sectors. This seems to work pretty well for SIO2PC.

SPARTADOS evidently expects to receive information which matches its expectations about certain combinations. For example, when told a disk had 80 tracks and 28 sectors/track, it assumed 18 sectors per track. This made the number of sectors available as reported by SPARTADOS much less than the number SIO2PC could actually offer with this disk image.

The bottom line is this: Even though you can choose a disk image of any size with the new SIO2PC option #5, you may have to adhere to certain standard sizes when using SPARTADOS. I've added a lookup table to the program. If the disk size matches a certain standard, it reports a combination of standard values to the Atari. Otherwise, it uses the MYDOS technique of 1 track holding all sectors. You could compute some standard sizes like this:

Number of Sectors = (#TRACKS * #SIDES * # SECTORS/TRACK)

Size in Bytes = (Number of Sectors) * (#Bytes/Sector)

(For the Size in Bytes, subtract 384 for double density, because the first 3 sectors are always 128 bytes.)

Enough Math. Here are the standard sizes you can use with option #5 which will result in standard numbers. As noted before, not all of these will work with SPARTADOS:

#SECTORS KBYTES DENSITY TRACKS SEC/TRK SIDES

630 80 S 35 18 1
720 92 S 40 18 1
1386 177 S 77 18 1
1440 184 S 80 18 1

```
980 125 S 35 28 1
1120 143 S 40 28 1
2156 275 S 77 28 1
2240 286 S 80 28 1

1260 161 S 35 18 2
1440 184 S 40 18 2
2772 354 S 77 18 2
2880 368 S 80 18 2
1960 250 S 35 28 2
2240 286 S 40 28 2
4312 551 S 77 28 2
4480 573 S 80 28 2

630 160 D 35 18 1
720 184 D 40 18 1
1386 354 D 77 18 1
1440 368 D 80 18 1
980 250 D 35 28 1
1120 286 D 40 28 1
2156 551 D 77 28 1
2240 573 D 80 28 1

1260 322 D 35 18 2
1440 368 D 40 18 2
2772 709 D 77 18 2
2880 736 D 80 18 2
1960 501 D 35 28 2
2240 573 D 40 28 2
4312 1103 D 77 28 2
4480 1146 D 80 28 2
```

All YOU have to pay attention to is the density and the number of sectors. SIO2PC will report the other numbers to the Atari. For MYDOS, just randomly picking a number of sectors, without regard to the above chart, seems to work fine.

As I said before, the addition of the GET and SEND CONFIGURAGION info commands in some cases did more harm than good. For this reason, I've added yet another feature. Now you can turn on or off the configuration transfer function. Since the main menu was getting full, I added this to the TIMINGS menu. Just hit 'A' to see the timings menu. Then hit 'C'. The status of the installed disks will be shown. 'Y' means they DO respond to configuration commands. Enter the disk number to toggle its status with regard to this function. I believe this should only be necessary when getting ready to format, if at all.

I realize this discussion of REV 3.01 isn't exactly simple. I hope you can glean the necessary info from it. It should be worth the effort to get ULTRA SPEED going and to cure formatting problems. Call or write if you have problems, bugs, or suggestions. I'd especially like any SPARTADOS experts to tell me how it tells me to go back to high speed.

What is the '@' command SPARTA sends to device $4F? Also any info on
how to get SPARTADOS to accept ANY size disk image would be useful.

From: omf@jab.tucson.az.us
Message-ID: <uy2egB2w164w@jab.tucson.az.us>
Source record: 112317

I hope someone who knows the Atari disk drives pretty well can post some replies concerning the problems Nick Kennedy is having implementing high-speed I/O on SIO2PC. Maybe someone can show this Bob Wolley or Robert Puff (both well known for their hardware knowledge).

Also, is anyone interested in a program that reads SpartaDOS disks on PC? I've got such a program half-way done but want to know what other people's suggestions are.

878. Re: Modems for Atari 800Xl ??

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-20 00:07:12 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <P72egB5w164w@cyberden.uucp>
Source record: 112334

As to your wondering about 800xl modems. There are many, old and new. Some are direct-connect (through the computer's SIO port.. the 13-pin one hooked up to anything "Atari", like the 1050, XF551, or 810 disk drives..), some need an interface, such as the P:R:Connection (P:rinter/R:s232 (modem) interface) or the Atari 850 RS232 interface, and there's even a few modems (and RS232 interfaces) through the joystick port! The 800xl has no RS232 as is.
As for WHERE to get it.. any place that sells any Atari 8-bit stuff probably has at least one model. There's one that is also for the 16-bit (ST) models, and IBMs, AS WELL as the 8-bit.. It has an RS232 (for ST, IBM, etc.) and the SIO (Atari plug) for the 8-bits. I have that model. It's called the "sx212", and is 1200baud, Hayes fully compatible. The only other speeds for hooking up to the SIO (correct me if I'm wrong) are 1200 and 300. Supra (I think) makes a 2400 baud that some use with their 8-bits (oops! BTW: 8-bit MEANS XL/XE and 400/800 models!.. as compared to 16-bit, which are the ST, STe, and TT models.. the ones with mice!). The Supra needs an interface I think. Well.. to cut it short.. call some of the following stores about purchasing them.. (though I think San Jose has run out.. and they had the better deal.. call anyways..)
San Jose Computer
1278 Alma Ct
San Jose CA 95112
408-995-5080 (cust servc)
800-726-8576 (ordering..MAY be disconnected??)

or

B&C ComputerVisions
2730 Scott Blvd
Santa Clara CA 95050
408-986-9960

Both of these companies deal ONLY in Atari (8-bit/ST) hard and software. Most of the employees know (or can find out) pretty much all you (and your friend) need to know.

As for software.. unless you can convince someone to give you a disk with some software on it, you'll straight off need to purhcase the software (note that the only NON-PD software I've seen pales in comparison to most PD software). If you get the SX212, you can purchase SXExpress! from SJComputer for about $10. If you want, you can call or write Terry Ortman about his PD collection of modem software (I noticed SXExpress for about $3 I think?) He also carries software (perhaps BobTerm?) for all/any modem (you'd better ask him) that should be pretty useful.

By and far the BEST modem software is BobTerm (I have version 1.21. I think the highest v. is 1.22?) It has all sorts of special and simple to use features, and it's best plus is the fact that when you leave Terminal mode (send and receive screen) to go, say, set some parameters, or macros, or something.. the terminal mode KEEPS receiving.. (you'd have to use weaker software such as SXExpress! or Term80 to truly appreciate BobTerm's ultimate coolness..) If you want 80 column on BobTerm, you'll need to get a peice of (somewhat expensive.. at least to one like me with $0) hardware called the XEP80, which intercepts any E:ditor sends and receives, and processes them into 80 column. 80 col. isn't that important, (esp. if you don't want to spend the $$!) because most BBSs allow you to set your terminal type to 40 column. I also have to note that BobTerm can send and receive in many more protocols than I've seen on any other terminal software I've come upon.. They include X-modem, X-modem/Crc, CIS Fast Modem (exclusive.. this is for use ONLY with CompuServe), 1k X-modem (sometimes mistaken as Y-modem), Y-modem (batch), F-modem (batch), and ASCII. You can ALSO even have it convert from ASCII to ATASCII and back just by pressing SHIFT as you enter the send or receive protocol on the menu.
Enough about BobTerm! (even though it IS the best!)... (BTW: it DOES support ASCII, ATASCII (Atari), and VT52 (odd and even parities.)
Robert Puff also has made an ANSI Terminal program (ANSITerm), but it is still "in the works" compared to BobTerm. There is also a program called DeTerm, which is only showy. It has pulldown (cursor-key controlled, of course) menus and help calls (via help key, I think? probably.. seems the obvious choice!) It DOESN'T keep receiving if you select (or even start selecting) on of the menus. It DOES have one neat feature, which is a Breakout game (even during send and receive.. that is-- x-modem, etc.) I'm not sure what protocols it has.. at LEAST x-modem.
There's also Term80 (VERY buggy), and it TOO doesn't receive.
BUT! It DOESN'T need hardware (just good eyes or a mono or VERY good (Amiga?) monitor) I can read non-monitor text, but for actual CODE (as in I have to recognize EACH character exactly, not just sorta), it's not the best. I don't highly recommend this unless you're totally against 40column. (now who could be!?)
SXExpress! is the nearest to BobTerm that I've seen. I thought it was great until I got BobTerm, so it IS pretty good. Only x-modem and x-crc send/rec., but if you must, get it just to get BobTerm!
Call or write Terry Ortman (or about any other PD software librar holder) about BobTerm and such.

Terry's at:

Ortman Enterprises
Suite 338
303 E Pershing Rd
Decatur IL 62526

Hope I've been informative! (I should work for "Classics" when it comes out!! haha!) Bill Kendrick

GOOD LUCK! Ive been looking for one used for a long time.
Those that have them seemingly wish to keep them.
I did get a DEAD one and managed to install a new chip in it.
Right now its at ICD because the other chip was also bad.
Thats CUSTOM and isnt found at all.
if anyone offers ya an rtime8.. buy it! They are hard to get.

884. diskcomm and mydos problems on atari.archive...help!

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-20 04:58:15 UTC
From: hussein@psych.toronto.edu
Message-ID: <1992Feb20.045815.11503@psych.toronto.edu>
Source record: 112324

Thanks for the previous response for my request for Atari PIA control register locations and functionality.

I've been trying to get mydos and textpro from atari.archive. Diskcomm.com loads under DOS XL with a slightly garbled screen but locks up after a keystroke. I was careful about doing all transfers in binary mode including using util to write Atari DD disks on an IBM machine...but I MAY have slipped... However, I can read the AtascII doc files for textpro at home no problem.

The autorun.sys file for textpro will NOT copy under DOS XL. It complains about a read error but my Rana says there were no read errors. I assume it is a multi-stage binary load. I forget the format of those files. Could there be compatibility problems with DOS XL?

There is another version of diskcomm on atari.archive. Are they compatible?

My system: old 48K Atari 800 and Rana 1000 SS/DD drive.

Any help would be appreciated.

Michael Mei

P.S. Using my friend's account again. I am mmmei@sunee

Re: programming techniques on 8 bits

Hi everyone. I just read this group at random cause I have an
original Atari800 I haven't used in a long time. I was wondering
what happened to the 800 scene. I've never seen anything on it
but a few very old cart. games.
I did do some programming on it and had books that went into
great depth about the chips.
So I have been able to follow every message here. I dare say
I could answer half the questions but I am not an active Atari
user.
There must be some amazing demos out there for the Atari.. I know
it has great potential.
You people don't realize how closely the topics you chat about
are matched by discussions in other 8bit groups. I am a big
supporter of the 64, and run an FTP site for it as well as being
nearly an expert on the ins and outs. Some of you could benefit
by asking a few questions in the comp.sys.cbm group, as there are
a lot more active 6502 coders out there who know the answers.
There are several techniques I should mention that have been highly
developed for the 64 and are equally applicable to the Atari.
One is the technique of changing color registers during every line
for improved color graphics. On the 64 this technique is called
FLI-Flexible Line Interpretation.
Let me see... if I recall graphics mode 7 and a half, the one
between 7 and 8 (mode14 I think) seemed to the best for good
color resolution (at least 6 years since I've thought of this!)
oh.. forget my memory.. you guys know the graphic stuff..
the idea is, get some mode that uses a lot of color registers,
and change these on every line and also along the line. The CPU
should be able to do I think 14 color changes on a single line.
You have about 64 microseconds per line, however many cycles that
is.
The other technique is flashcolors and flicker mode. Use two
bitmaps, and switch between them every screen.. so it changes
60 times a second. The flickering colors will combine to an
in between looking color.. not that the Atari really needs more
colors, but that you can overlay two screens together for better
resolution.. like they could every be different graphic modes
to add detail to a mode 9 picture.
One thing I do remember.. if you STA $d01a I think it will stop
the CPU until the beginning of the next raster line, making
video synchronization really easy.
The other technique we have is overscan.. this is using a larger

screen area than you can normally access. We use sprites to add
graphics to the area outside the normal screen border. This is
really easy on Atari. Use a pair of Player graphics in the
sideborders... the Atari screen can actually display up to 342
pixels across. P/M graphics too far off the left or right after
that gets cut off.
Also vertically there are about 242 screen lines. You can add
more graphics instructions to the display list to use a full screen
vertically (this is better than the 64 can do by far!).
Then there is tonnes of DMA tricks, which are mostly irrelevant on
the Atari since they could be done anyhow. One thing you can try
is incrementing the fine scroll y register on every line and see
what happens.. the equivalent on the 64 will cause the display of
the screen to be delayed and hence it will move the entire screen
downwards automatically.
Then there is tonnes of ideas used for demo effects that I don't
know if you have discovered. I suggest you spend some time looking
at 64 demos to get ideas. Like 3D color bars.. what we call a color
bar is background color register changed on each line to make a
bar of colors across the screen. Usually the colors are arranged
to be brighter in the middle of the bar. Two bars move up and
down in a restricted area, and change vertical size to look like
they are receding in the distance, to make it look like it is
revolving in 3D.
Then for sound... well, I hope there is the equivalent of rockmon,
it would be awesome! Rockmon is a two voice digital sample player,
that also uses the normal 3 voice music. You can have quite
a sophisticated drum track. Your CPU is much faster than ours
(Atari=1.785, 64=1.022727), and you have more digi outputs..
the way you use the 4 bit sound control is the same thing with
us. 4 bit volume control I mean. Your routines could be much
faster because you have separate volume registers where we have
to add two samples together and play in one register, which also
means your sound quality would be much higher.

Well after writing all this I guess I can accept mail about ideas,
but I can't promise to answer specific programming questions!
I used to know the Atari really well, with combining voices,
playing with display lists, timers, interfacing etc. but can
hardly remember anything specific...
Please e-mail to:
yurik@iris1.ucis.dal.ca
Hope you got something out of this long message!

887. Avoiding distortion with digisound

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-20 07:06:42 UTC

Re: Sampled sound quality

I just had to say, I was reading a thread, and the answer seems
really obvious to me.. when playing sampled sounds (we call them
digi's) on our machine we have the same problem with sound
distortion with the screen on. Sounds like I'd lose you if I try
to explain why. But it is due to DMA.. DMA is when the graphics
chip stops whatever the CPU is running for a moment to access
the RAM to get video data so it can display it.
This pauses is what slows down the apparent CPU speed. Note the
CPU speed is always 1.785, just that it gets paused regularly.
Now, the important thing in playing digi's is to time the playing
so that the samples are playing exactly at the right moment,
at each time period for the sample rate.
If you use a simple delay loop in assembly, this will not work
with the screen on, because sometimes the delay will be paused by
the DMA, then the timing will be off and you have distortion,
as well as having to adjust the speed up to make it average out
to the right timing.
The answer is to use interrupts based on a timer. Set the timer
with the value needed to play the sample at the right speed,
then your interrupt will play one sample each time it happens.
Now the timing is independent of whether or not the CPU is stopping,
because the timer always runs. It will sound much better.
The other thing is with the normal interrupt.. VBI it's called.
The first thing you should do when you get an interrupt from
the timer is disable the VBI.. in fact you can get rid of it
totally for the purposes of a demo... the first part updates the
shadow registers and some counters and reads the keyboard.. I
can't recall.
With your way of playing digi's, the VBI will add to the distortion
as well.
How have coders developed on Atari? There are a lot of total wizards
in the world of 64. Is there a big underground demo making society
with the Atari? Was there?
Later.

>Any ideas how to connect it to the ST?

I can remember there weren't any ribbon carts available for my 1027
in Sweden back in 1990. I took the one already fitted and brought
it to an IBM/Xerox retailer. They found a different ribbon cart that had
an ink roll looking almost identical to the 1027's. The 1027's ribbon
cart can be disassembled, then you simply put a new ink roll in it. I
think this particular one was manufactured by 'Pelican'.

However, my 1027 wasn't any good. Incredibly slow, and the print-outs
didn't look too impressive either (to say the least).

My mail address is etxansk@garbo.ericsson.se no matter what the article
header says.

Source record: 112332

About the overscan . . . you can set bits in SDMCTL (loc. 559 ($22F)) to enable
the different line widths. Here are the bits:

0,1 : Playfield width (0 = no playfield)
(1 = narrow; 128 color clocks wide)
(2 = standard; 160 color clocks wide)
(3 = wide; 192 color clocks wide (enough for full
overscan))
2 : Enable missile DMA
3 : Enable player DMA
4 : One-line player resolution
5 : Enable Antic DMA

SDMCTL is the shadow regiser for DMACTL (54272 ($D400)).

This info from _Mapping the Atari_ by Ian Chadwick. Get a copy if you can!!
It's a great book.

>background).. and sets 711, if inverse is used (ONCE again.. depedning on
>the chset), to an inverse color. ...

I don't have an answer to your question, but I would like to point out
another way of adding colour to a standard 40x24 text screen.

You can put all 4 player patterns and the 4 additional missiles to occupy
the full width of a 40 character screen. (If they're expanded to maximum
horizontal widht.) Then one single player will correspond to 8 characters,
so all 4 players correspond to 32. The remaining 8 characters (32+8=40)
can be filled in with 4 missiles, each corresponding to 2 characters.

A clever DLI interrupt will offer at least one extra colour for each
single text line. Player/missile colours can be reprogrammed during
horizontal synchronisation.

The best solution is probably to avoid p/m DMA, cpu access to p/m
pattern registers is much faster and costs less memory. I only wish there
was a way to make my good old 800 display even more colours in the
40x24 text mode.

By the way, does anyone know how many vertical lines an American
TV set can display? Is 224 too many too keep vertical synchronisation
running safely?

Well, I don't know if this is what you wanted, but I wrote a
program that would let you define some defaults, like screen colors, I/O
beep on/off, key click, and then my prg would write a short prg that you
[L]oaded from dos. (Actually, I was using Spartados, so I would just
type "LOAD DEFAULTS" at the command line.) If there is any interest, I
migh be able to post it. (I was originally going to send it in to
Analog, but I never got around to make it a lot more easier to use, so I
never quite finished it, although it works in the state it in right
now.)

Subject: Info Kits
To: Into-Atari8 Digest <Info-Atari8@naucse.cse.nau.edu>

-------> campaign update <------

For those of you who haven't received info-kits yet and have already sent
your address within the last two weeks. Please be patient.
This week and half of next week is finals time here at the university.
I had to let the Campaign sit so that I can study for classes.
Be assured however, that once my last final is done on Wednesday at
4:00, I will be coming home to hit the stack of mail, email, and
everything else that has come my way in the last two weeks or so.
I apologize for the delay this has caused to everyone, but it couldn't
be avoided. My engineering classes have to take priority for at least
a small amount time over the campaign.

Sincerely,

Jeff McWilliams

902. Quick "Trick 320 Demo"...

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-21 04:47:35 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <1T0ggB1w164w@cyberden.uucp>
Source record: 112349

In case anyone wanted to see it "in action" (hehe), here's the "Trick 320 Demo". It's purpose is to let you use the multicolored text modes (IRG 4&5, which are ANTIC 4 and 5, and GRAPHICS 12 and 13), but still have the same quality as when you're in the normal text mode (ANTIC 2, GRAPHICS 0).

When one normally uses IRG modes 4 and 5, they are forced to usually draw the text as 4 bit text. That is, 4 across by 8 down, rather than 8 across by 8 down. This is because only 1 bit is needed to say on or off (black or white, or whatever) in the 320 mode. But like in the 160 modes (GRAPHICS 6,7,14 and 15 (aka 7 1/2 or 7+)), you need 2 bits to let you choose from >4< colors (off, on1, on2, and on3.)

In the 160 mode (IRG), you'd start out simple with, say, the following for the letter 'A':

```
1234

*
***
* *
***
* *
* *
```

```
----
```

This looks okay; but when you're going for things like '0's verses 'O's, or trying to write an 'M', ', or 'W', you'd be fod to do this:

```
1234
* *
* *
* *
***
***
* *
----
```

This looks too much like an 'H'. What is it supposed to be? It's SUPPOSED to be a 'W'. If you NEED to be able to tell the difference, any (and) you're in this mode, you'd need to reduce the number of columns to 40 (if you're drawing it, say in mode 15).

But... here's how trick 320 works. It forces you to dedicate at least 2 colors, not 1, to the drawing of characters. But this is not very important, especially if you're using a DLI to change the colors or something on certain parts of the screen. But still, even THIS isn't

important.

Here's what an 'A' would look like in my mode (not exactly as the demo
shows, but you can use an editor to change it...)

1234

```
+*+
***
* *
***
* *
* *
```

Notice the '+'s. They would stand for "medium" colors. The " " can be
black, the "+" grey, and the "*" white. Some characters look even BETTER
in Trick 320 than in real 320. The "a" for instance. Then again, some
DON'T look quite as good, such as the "M" and such. But still, they are
FAR better than in the normal 160 mode.

God.. this text is long! In case one were to be impatient enough to skip
all this technical stuff, I'll just post the 3 or 4 lines of code needed
for my demo on the next message.
Thanks for reading this far!!! ;)
Bill Kendrick

>to add two samples together and play in one register, which also
>means your sound quality would be much higher.

I'm not sure, but I suspect that the 4 different 4-bit volume control
registers are added and crammed into a 5-bit internal register. This means
you're not supposed to have a sum greater than 2^5-1 (zero count) = 31.
If you exceed it, the sound will be distorted.

The best way to find out is probably to measure the sound output
voltage for different volume settings.

I think you mentioned the lack of new software for the 800. That's a
fact, but take a look at these games:

Koroni's Rift (stunning graphics, fast shaded 3D)
Rescue on Fractalus (fast 3D, exciting)
Electraglide (colourful, fast, and boring)

(Atari) Clock Calendar -- Software for 8bits

A friend without network access has developed a very effective clock calendar for any of the 8-bit (Ataris). The software, written in Basic, allows any old 8-bit to control relays, or perform other interval timings.

Features of the software include the ability to set intervals as short as a second and as long as 1000+ years [hope you're around to see it shut-off]; leap-year and daylight savings recognition; the ability to set the interval starting date to any day up to 10**99 days ahead. The software is available in source for the hobbyist to build into any application that (s)he likes.

If you are interested in finding out more about the advanced clock calendar, please contact the author

>One is the technique of changing color registers during every line
>for improved color graphics. On the 64 this technique is called
>FLI-Flexible Line Interpretation.

On the 800 this is a built in feature: display list interrupts.
You don't have to go through any sort of fancy contortions. The
C64's palette is so limited, though, that I can see where this
would be a big deal in the Commodore world :-)

Irrelevant technical quibbles aside, this posting got me thinking.
If the Atari 8-bit world is to stay alive, or even grow healthier,
then would-be software developers need to avoid the following
traps:

* Graphics demos - heck, they look neat but there's no point in
spending months coding something that people look at once and
then set aside. Write an application instead.

* Emulators for other computers - A formidable task, to say the
least--one with little benefit. If you want to do something
challenging, write an application instead.

* Nintendo-style video games - If someone wants to play platform
games and kill-the-boss games, then they can spend $70 on an NES.
Games are fine, write them if you wish. But the Atari 8-bit
computers are not Nintendo wanabees so don't make them look like
it.

* Clones of "real" computer software - You'll never get anywhere
if you try to put the 800 on equal grounds with 386 PCs and Sun
workstations. The Atari world does not need Windows-like GUIs,
Unix variants, Word Perfect lookalikes, and other bloated software
monsters. Think about it--your XE gives you the chance to throw
that all aside and do it RIGHT.

>pixels across. P/M graphics too far off the left or right after
>that gets cut off.

One other quick note. The above is also standard on the Atari 8-bit computers. Just select the "wide playfield" option and--POOOF--you can now use the overscan areas without resorting to player/missile tricks. And as you noted, using the vertical overscan areas is also very easy.

I've poked around the cbm newsgroup, and the C-64 people are a different crowd. They are bent on proving to the world that the C-64 is the world's ultimate computer, all logic aside. I think the average C-64 owner is much more of a "hacker with score to settle" personality. (Note: this is most likely a gross generalization.) I'd like to see the Atari camp maintain a more relaxed and professional attitude. The 2600 Connection is not always lashing at the throats of its competitors, but those Genesis/Super NES people are just out of control...

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <54798@cup.portal.com>
Source record: 112258

I can't recall all the details, but I've heard that from more then one person. Seems probable for a couple of reasons, but then I'm pretty gulible anyway <grin>. The explaination(s) usually go something like: Computers that use other processors use more clock ticks to execute a single instruction i.e. 16 ticks vs 8 for the 6502 => why a 4.77 mHz PC is only about equivalent in processing power to a 1.79 mHz Atari. The 6502 accesses page zero ram in half as many clock ticks as the rest of RAM because it doesn't have to put the upper 8 bits on the address lines. The old PC's even came with 200 nsec RAM & you could go to 10 mHz with 150 nsec chips. Anyway, the way we're set up ('cause it doesn't make sense to have 256 bytes of fast ram + 63.75k of slower ram) is with fast ram for the entire address space. It's not clock speed, but how fast the CPU operates on memory

909. Toronto Atari Show - Apr 4 & 5, 1992

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-21 19:05:45 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1992Feb21.190545.2515@watmath.waterloo.edu>
Source record: 112353
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,uw.sys.atari,kw.micro,ont.micro

On April 4th and 5th, Atari Canada and the Toronto Atari Federation will host what may be the most exciting Atari event in North America in 1992. To be held at the Skyline Hotel on Dixon Road, near Pearson International Airport, , ACE '92, the Atari Canadian Exposition will feature the most outstanding developers in the Atari world with some of the latest programs and program updates. Local dealers will exhibit the latest hardware and peripherals, and user groups from across Canada and the United States will be on hand to share Public Domain and Shareware programs and exchange knowledge. Door prizes throughout both days of the show, special show prices and several major door prize packages will add to the excitement.

Facilities will include a 22,000 square foot convention area, an additional 7,000 square foot display and exhibit space, and 7 separate meeting rooms that will host a wide range of seminars, demonstrations and mini-concerts. On Saturday evening, a formal banquet will bring together local users with major figures in the present and future course of Atari.

This is the third major convention that the Toronto Atari Federation has hosted in recent years. As one of the largest user groups in Canada, if not all of North America, TAF has consistently helped bring the best and most contemporary computer technology to Toronto users. With membership of approximately 300, TAF will provide the core volunteers that make an event like this possible. However, other user groups will also be invited to participate, to help stimulate exchange of information among the various Atari groups in this region and to help broaden the base of support for this special event.

Atari Canada General Manager Geoff Earle has said that this April event could easily surpass the recent Chicago convention, both in attendance and participation by developers and programmers. Basing their participation on the successful Chicago model, Atari Canada will assume many of the initial commitment costs, including facility costs and advertising. TAF will coordinate activities and provide volunteer help. TAF President John R. Sheehan, SJ noted, "The enthusiasm of our members is the reason we felt this was a good time for a show. So many members had been asking about a show, and volunteering to help that we felt we really could present a spectacular two-day event. We couldn't try it without our volunteers, but with their help, this April will see the most exciting Atari show Toronto has ever seen!"

Packets for dealers and developers are being prepared and should be mailed by the end of January. Information packets for user groups will be available at around the same time. The Skyline Hotel will be offering

special room rates to participants, and special travel plans should also be announced shortly.

To be placed on the mailing list for Convention information, please send your name, address, and affiliation (developer, user group, dealer, etc.) to TAF's mailing address, 5334 Yonge Street, Suite 1527, Toronto, ON M2N 6M2 or leave a message at (416) 425-5357.

ATARI TALENT SHOW ANNOUNCED
"""""""""""""""""""""""""""

As part of the Atari Canadian Exposition, ACE '92, April 4/5, a special talent competition has been announced. To demonstrate the many ways that Atari computers can be used in creative entertainment, two divisions will be open for submissions. The contest is open to all Atari Users.

MUSIC AND SOUND

Since Atari has long been an industry leader in MIDI applications, one division will be open for applications of sound and music. Entries may be live performance, combination of live and pre-created or totally pre-created arrangements of music and sound. Entries may be original compositions or adaptations of existing material. (Initial submission must be made on cassette tape; if accompanied by visual effects, appropriate disk program or description must also be included.)

GRAPHICS OR ANIMATION

Since Atari can manipulate over sixteen million separate colors, visual arts provides another rich field for creative work. In this field, entrants may submit animated segments, or graphics displays. Submissions may include "slide shows" of created works, demonstrations of works being created, or animated creations of any type. Entertainment value will be the criteria for judging.

Individual presentations should last no more than 10 minutes. Entries will go through preliminary judging, and those who are accepted will make public presentations or performances throughout the day on Saturday, April 4th, at ACE '92. Performances will be open to those attending the Exposition at no charge, and judging of finalists will take place prior to 4PM. Winners will attend the evening banquet as guests of Atari Canada. Each contestant will present their entries or performances at the evening banquet, at which time they will be judged a second time, and prizes awarded. Judging will be on the basis of creative use of the computer and entertainment value.

FIRST PRIZE in each division will be a $700 gift certificate from Atari Canada, good towards the purchase of any Atari product, and a one-year membership in the Toronto Atari Federation.

SECOND PLACE WINNERS will receive a $200 gift certificate from Atari Canada, and their choice of 10 disks from the TAF Library. Third Place

Winners will receive a $100 Gift Certificate, and their choice of 5 disks.

For an entry form, contact:
ACE '92, c/o TAF
5334 Yonge Street, Suite 1527
Toronto, ON M2N 6M2
Or call:
John R. Sheehan, SJ
TAF President
(416) 926-1518
or
leave a message on the TAF BBs
(416) 425-0318.

ACE 92 TO FEATURE GAMES AND 8-BIT
==========

ACE '92, the Atari Canadian Exposition, will be held in Toronto on April 4th and 5th. As part of the many different events scheduled for the two-day exposition, two separate games areas will be set up with equipment provided by Atari Canada. A nominal charge of $1.00 will be levied for admission to each area, with all funds raised here to be donated to Sick Children's Hospital in Toronto. Admission to the Games Area is in addition to the regular admission charge.

Area 1 - THE LYNX CHALLENGE. The $1.00 contribution admits participants to a timed game playing session. The high score in each session is registered. At the end of each day, a special prize package will be awarded to the high score of the day. The package will be provided by Atari Canada and will include: One Lynx machine, AC adaptor, and a collection of games.

Area 2 - GST AREA (Games - Sampling and TryOut) $1 contribution admits the participant to sample one game cartridge. A variety of games for the Lynx will be available, but each "Tryout" requires a separate admission to the area.

Many of the dealers present will be offering special discounts on a wide range of game for different Atari machines, as well as significant savings on games cartridges and games programs. Although most of the exposition will feature more "serious" applications on the Atari platform, there will be a good selection of games available, and serious players to share hints and help.

There will also be a special area for 8-bit dealers and developers, a place for the dedicated XL/XE user, those who still have and use the 800 and 400 machines. Although commercial programs are getting harder to find, many clubs will have their public domain and shareware libraries available, and dealers who still have 8-bit material will have it available.

ACE 92 will be held at the Skyline Hotel on Dixon Road, near Pearson International Airport.

Further information, exhibitor's kits, advertising rates and advance ticket sales may be obtained by contacting:

ACE '92 c/o TAF
5334 Yonge Street, Suite 1527
Willowdale, Ontario M2N 6M2.

910. Trick 320 code...

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-21 20:33:39 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <smHigB5w164w@cyberden.uucp>
Source record: 112259

Sorry about not finishing my 2-messages about Trick 320, as I got disconnected (in a rather HARSH way! 1/2 line of "U"s and whatnots, and then no response to [RET]s and stuff.. I was still OffHook and CarrierDetecting... hmm)

But.. here's the code (written in TurboBasicxl):

to make the character set:

```
CH=(PEEK(106)-16)*256:POKE 756,CH/256
FOR A=CH TO CH+1024:Z=PEEK(A):IF Z&%1:Z=Z+255:ENDIF:POKE A,255-Z/%2:NEXT
A
```

to set an IRG screen (use GRAPHICS %0 before the CHset, or just rePOKE 756,CH/256 once you turn on the new screen.):

```
DL=DPEEK(560)+4:FOR A=%2 TO 24:POKE DL+A,4:NEXT A:POKE DL-%1,68
```

to set up some screen colors:

```
POKE 708,8:POKE 709,8:POKE 710,%0:POKE 711,68:POKE 712,15
```

Ok.. what it does, is move all the characters over 1 bit and inversed. Then, it switches the screen into GRAPHICS 12 mode, but still in GRAPHICS 0, so you have the editor and stuff. THEN, it sets the "01" and "10" bits to "grey", the "11" bits to "black", and the "00" bits to "white". Now, when inverse is on (Atari sign, or the triangluarly-filled box button is pressed), the "11" bit color is changed from black (or whatever location 710 says) to red (or whatever location 711 says). If you want one of the two first-color locations free (708 or 709), just use a character editor (preferably an IRG (multi-color/GRAPHICS 12/ANTIC 4/WHATEVER!!) editor), and change all of one into the other. (if you're using a normal, 2 color editor, change the "01"s to "10"s or vice versa.) Now one of the color locations is free for other uses. Note that most inverse control-characters don't work well (such as the triangles), but the red does make it look neat.
Well.. that was it! Enjoy!

911. Shivery scroll effect

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-21 20:38:30 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <VuHigB6w164w@cyberden.uucp>
Source record: 112260

If any of you have seen many commodore 64 or Amiga demos, or played Ninja Gaiden II for Nintendo well, you've probably seen the "shivery scroll effect." Take a title one the top 1/4 of the screen, that's about 1/2 the width of the screen, and then centered. Now make it waver, as it it's a rubber band (have the top and bottom to one side, and the middle to the other, and vice versa, all done fairly smoothly). I'm planning on trying that just for fun, and am wondering what else is needed other than a pretty good DLI. I've played with some of those "rainbow" routines (like on the ATARI when you first go to the HELP screens.. at least on the 1200xl) and shoved them into sprites and scroll registers, rather than color registers. The sprites look REALLY wierd. The move from the left to the right, and they are BENT! Looks REALLY interesting (I think the "beat-it" demo from expo91 uses something of this sort for bending the sprites.. BTW: does it flicker horribly on ALL computers, or just the 1200xls, or just the non-european ones???)
So.. any tips from pros, or should I just get on with it
and post it when ever!?!?!? :) Thanks! Bill

912. diskcomm and mydos problems on atari.archive...help!

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-21 21:33:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-02-21-13:33:08.02*UJ1G"@DKAUNI2.BITNET>
Source record: 112263

i'm only a few weeks on the net and at the beginning I had exactly
the same problems getting stuff from atari.archive.

It's kind of complicated to do this. First I have to get files to
the IBM3090 mainframe then transfere them to a PC and then using
util.exe to the Atari format.

I know the reason for your trouble. The program UTIL.EXE is kind
of buggy. It isn't possible to transfere binary files with it
no matter if you use the /b or /B command or not. The program changes
all IBM cr/lf characters to ASCII 13 character. If you don't believe
me, check your downloaded file on the Atari, you won't find a single
byte in it that has the value 10 and .??.(the other line feed characte r
on IBM). This is the reason bacause your downloaded binary files
don't work. To overcome this problem, you have to UUENCODE them on
your sun or PC system and then transfere it to an Atari DD disk.
The UUENCODER translates all bytes in a program to printable character s
so they can be transmitted through systems that perform character
conversions (like the program UTIL.EXE). When you finally have your
files on the Atari use an UUDECODER to turn them in ordinary binary
files. You can find the UUDECODER for your Atari on atari.archive.
It is called UUDECODE.BAS (I could be wrong). It is stored on the
archive in a LIST format, so you have to ENTER it into Basic.
Don't worry , Atari LIST files don't get damaged while transfered
using UTIL.EXE. The first thing you have to do, when you finaly
have the UUDECODE.BAS on your Atari is to get all arc utilities as
described above. You should get the program UNARC.COM then the
program DISKCOMM and the program YAU.ARC(?) which is a much better
UUDECODE utility.

That's almost all. Almost because UTIL.EXE has another bug.
It can happen that some of the sectors written on the Atari DD disk
are inverted(!!!!) (all zeros are turned to 1s and vice versa)
then you get always that error 164 while processing that file.
This is a minor problem as you can reinvert the sector using a
DISKFIX program. Sometimes UTIL.EXE manages to forget a sector it is
simply not on the disk (you can watch it with the DICKFIX, you'll
see a sector filled with zeros in the middle of the file . The DOS
assumes the file has ended when it encounters such a sector, but it
is not!!!). All you can do is to download that program again.
Boy is it annoying. I needed almost 10! attempts to get the EXPO91
demo.

I hope this will help.

later...

Marek Tomczyk

>any other demo I've seen. Comments?
>
I downloaded the DAS OMEN program. I like the music, and the image is pretty
good, but when the dancer starts, my monitor disply jumps up and down, like it
is missing a VSYNC or something. Does this happen to other people, or is my
monitor flaking out? Could this be caused by different timings of PAL vs. NTSC
video signals? Germany uses PAL, doesn't it?

Source record: 112256

I thought I'd re-post this piece after seeing Anders Skelander's response to Wolfram Roesler's inquiry RE: the 1027 in IA8 #53. The 1027 doesn't take a ribbon, it requires a roller, as Mr. Skelander describes. However, he only describes replacing the roller itself. It sounds like Wolf needs the whole assembly, just the roller is useless. Wolf, post your mailing address here, I'll send you the assembly, minus the roller, for free, if you are serious about using the 1027. Don't bother trying to hook up a 1027 to an ST; the exercise would be like putting roller skate wheels on a Formula 1 racer. The power supply for the 1027 is physically similar in appearance to the black transformer for the 1050 drive, only slighly larger & with a different plug. The 1027 pwr pak puts out, I think, 9VDC @ a couple amps (memory migh not be perfect there). You could probably get the pwr pak at Best Electronics, B&C, ATV, or San Jose (sorry, I don't carry those addresses in memory). The manual originally supplied w/the 1027 was a joke, the useful info it contained was decimal codes for the international characters. Best probably has it. The 1027 is slow, about 10-20cps, & a bit noisy, but DOES produce letter-quality print & should last a long time if properly maintained. Problem is, no one knows how to maintain them. The CN article described below is a mini-maintenance manual for the 1027.

From: PHVAX::POEHLAND 11-FEB-1992 11:04:40.31
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: 1027 Printer Problem

I disagree quite sharply with Craig Rothman's advice to Tony Falcone (IA8 #42, 11 Feb 92) to trash his 1027 because of its apparently erratic behavior.

As one whose primary printer(s) for many years was(were) two 1027's (one of which I still have), it is my opinion that the 1027, properly maintained, is just as useful & productive a piece of machinery as any other peripheral.

Tony's problem is not primarily one of hardware, but rather a lack of information. Tony needs to lay hands on the Feb. 1991 issue of Current Notes, where he will find an article titled "Secrets of the 1027 Printer". In that article Tony will read the very symptoms he describes, & how easy it is to fix. The problem is lubrication. Use Lube Gel from Radio Shack, & make sure ALL the bars get lubed, not just the head bars but striker bars also (I think there are 4 bars altogether, not sure of the details here). You have to disassemble the case to do it. THe article contains detailed instructions for disassembly & lubing. It should be done about once every 2 years, & you should NEVER touch the bars with your <sweaty> fingers.

The only REAL problem with the 1027 is getting reliable replacement ink rollers.No one who uses a 1027 should EVER throw a used one away! The reasons for this are described, in hideous detail, in the CN article.

The article was written by The 8-Bit Alchemist.

916. MAIL SURVEY CAMPAIGN GOES INTERNATIONAL

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-21 23:07:44 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9202212307.AA08009@smithkline.com>
Source record: 112257

In response to Chris Chiesa's suggestion for extending the deadline on the Campaign, be advised this idea has already been under consideration for the past few days. No decision yet as to whether it will be extended, or by how long. Such news will be posted to the Digest as soon as possible, perhaps next week (?).

Jeff McWilliams & I have been greatly cheered by the addition of Mike Jewison to the Campaign Team. Mike will be handling Canadian mailings beginning next week (if the pkg I sent him arrives in time!). This will relieve me of most of the burden of the International Campaign, since 75% of international mailings so far have been to Canada. Mike also knows the local territory a lot better than we do, so kit mailings & spreading the word up there should proceed more efficiently than Jeff or I alone can manage.
I am still handling all Kit mailings going out to non-North American addresses (we've only had maybe a half-dozen so far).
Jeff is still handling all the database work for the entire Campaign, plus all mailings to domestic addresses (which is about 85% of the total effort).
At the moment Jeff's end of things is necessarily a little slow as he must focus his attention upon exams. He has kept me posted on this & I am in complete agreement with his priorities. I'm sure he'll be gearing up again in a few days.

A few stats, in case anyone is interested. Since the beginning of the Campaign I have printed up 700? 800? Information Kits (geeze, I'm starting to lose it here). Of these, approximately 400 have been mailed out to individuals or user groups, & ca. another 150 are in transit to Jeff/Mike. I've purchased roughly 900 postcards, 800 stamps, 1750 envelopes, & 4000 labels. I've printed up about 2500 labels & run off roughly 6000 individual xeroxes. Ad copy has been distributed to Current Notes, Atari Interface, & Atari Explorer (the first CN ad just appeared last week). Brad Koda at Best Electronics, & Bob Puff at Computer Software Services, are supporting the Campaign by stuffing outgoing orders with copies of Jeff's press release announcing the campaign. Response from those sources has just started hitting Jeff the past week. I'm afraid to look at my checkbook, but I've plowed roughly $600 into the Campaign so far.

I've spent so much time living among xerox machines, I've given names to the two I use most frequently: Big Mama & Lil' Hummer. Mama handles all copyin on 8-1/2x11 paper, while Hummer prints the form on the postcards. Virtually all the materials I send to Jeff & Mike are produced using an 800XL based system & the copy machines. I don't allow any PC/Mac/ST stuff to taint the materials, & Jeff maintains the database on one of his 8bits.

Now I realise my reply to Wolfram Roesler's article may have sounded
a bit strange. I didn't care to check what the English word 'ribbon'
really means. I hope it wasn't too confusing.

Tie yellow ribbons in the old oak tree. Rollers won't look great.

You're probably right about the reliability. But still all the 1010
tape recorders I've ever owned were tape killers. The problem was that
the roll that's supposed to keep tension in the tape lost its grip
and chewed the tape. I still believe that to cure a bad 1010 you don't
need a computer repairman - you need an exorcist.

>my copy! Bill

I bought Zybex back in 1990, and it's made by European (probably UK)
software producer Zeppelin Software. I don't know if they're still alive,
but I think it's far worse to copy software written by software houses
that are still supporting the 8-bit Ataris, than to copy (for instance)
old Datasoft and Synapse games.

The copyright is a problem. I can't see that anyone is hurt
if I should spread copies of games that are "old enough". It's needed
to keep the 8-bit community going. Only my opinion.

To: ALL!

I have developed an interest in a computer system to access Lyrics
of rock music bands. I have several ideas and would be interested
in working with somebody on developing this idea.

These are some things I'm wondering about:

A. What type electronic access to a lyric database exists?

B. Has this been done before?

C. Has there been any consolidation of publishing companies
regarding the rights to the lyrics?

D. Is there a market for an information service such as this?

If anyone else out there has such an interest, or is pursuing this,
I would be interested in working with you. I have many ideas and
feel I could contribute.

I would like to earn some money developing this, but also have a
personal interest in it as well.

If you are interested write me at:

Well.. that I suppose would be ok, except for the fact that I HATE the
fact that MyDOS loves to reload itself (ie, if I had my "defaulter" on
another disk withOUT "DUP.SYS" on it, it will just sit there checking
EVERY drive until it finally finds it.) I'm wondering if there's some
sort of "return" code or something I need to add. I THINK that DOS2.5
works ok with this type of stuff (I played around with a cassette player
program, just a POKE 54018,52 in binary load format, that is
255,255,lbs,msb for 54018,52), and it never reloads. Any help??
Thanks. Bill

927. Das Omen 2 parts?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-23 08:47:11 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <c00kgB5w164w@cyberden.uucp>
Source record: 112267

I got a copy of Das Omen as two uuencoded messages. I used the uudecoder (the basic one! ik!) (also, I needed to convert it from ATASCII to ASCII... GET is SOOO SLOW compared to INPUT.. even in TurboBasic! Perhap's I'll compile it! (or TRY once again to get YAU!)).. as I was saying before. I uudecoded each file, and then appended them together (into a third file). I then used DiskComm3.2 to turn it into a disk. BUT! I got an error at sector 298. So I tried FileFix2 on it. It didn't help. So I tried chaning the max sector (I noticed someone mentioning that they did and it worked). First I changed it to 2000, then to 9999 (just for the hell of it). Neither helped! I got the bad bytes error! Then I tried to un-dcm just the 1st uudecoded file. It worked.. up until >298!< THen I tried to un-dcm the 2nd of the uudecoded files.. It didn't even recognize it AS a diskcomm. file! HELP! Anyone know whats up? I asked for a 1 part uuencode of it, to see if that helps. Perhaps I'll try undcming my first or second (or third, or FORTH!.. etc) download of AWESOME from AtariBase BBS, and see if I get the bad-bytes at the same place. Maybe it's my copy of DiskComm?! Hmm? What version do you folks have? I've got 3.2... Thanks for any help! Bill

Source record: 112270

Not to quibble, but IMHO: you've just eliminated 98% of what could be done<g>
Seems most applications have been addressed [tele, WP, Spread Sheets, etc]
& unless you have an absolutely dynamite idea, equivalent to what Visacalc
was in the 70's, that no one has thought of yet... I still program mostly
on the 8-bit 'cause it has the best programming tools & I get as much
satisfaction (more really) out of it as my ST or Clone. I used to think it
would be more productive to have a computer independant language so you
could cross develop programs on any platform, but after I got a Basic
written in 'C for the IBM, I couldn't find ANYONE with an ST or Amiga or
Mac 'C to even try compiling it. I imagine if I did, no one would use it<g>.
Can't figure out why the idea had such a 'warm' reception, must be me!
Since were in a commie thread, I have noticed that a lot of fairly new titles
have come out for it. In particular [Pirates, SSI AD&D]. This type game
translates well to 8-bit formats & ALL the screen layouts are in 40 column
format. Let's face it though, the ST will not even see 1/2 the new titles
because we don't have a big enough user base. I'd be interested if by some
bizzare set of circumstances SSI release Pools of Radiance for the 8-bit
and gave it away for FREE. I'd like to know how many copies they give away
to get some idea of the size of our user base.

Does anyone out there have a plot/draw routine handy for either APAC/APAC Interlaced/or ColrView modes? (esp. something simple that I can BRUN from TurboBasic, and then call USRs to... or something like that) Or are there any paint programs for these modes? Also.. I'd LOVE some routines to actually SWITCH into these modes. (I know that ColrView is QUITE difficult, and probably takes a ton of ML time to keep all of the DLI's ticking.. so it's not as important...)
After seeing the Awesome demo, and ILBM reader, I REALLY'd like to have (or make) a high-color paint program. Anyone? Anyone?

AND.. is there anyone so much of a genious to be able to make a COLOR digitizer!? I know little about ComputerEyes, and I'm wondering if it FORCES B&W input? I know that the scanning software can only do 4 color in 160x192 unless you purchase the 16 color 80x192 software. Has anyone tried to make a 80x192x256 or 80x192x4096 scan handler? Or how about 80x192x256 greys? (two 16 shade modes stacked & flipped...) Hmm? (I'm probably asking for someone to spend there LIVES working on it!) Well.. just a thought (dream)... have a good day, folks! Bill

Hmmm.. It depends on how the original binary was converted into two UUencoded parts. If the original poster split the binary and encoded the two parts separately, you did the right thing and it should have worked. Usually, though, the poster UUencodes the original binary into one big UUencoded file, then splits THAT up for mailing/posting. In that case, you have to edit out all message headers (To:, From:, etc.), any signatures or other "trailing" data, append the two resulting UUencoded (.uue) files together, and finally UUdecode the one-big-file resulting from the append. The important thing is that the file should START with a "begin" line (containing the word "begin," the name of the file that is to result from the UUdecode operation, and a three-digit number representing "file protection" in Unix notation), end with a line containing the single word "end," and have ONLY UUENCODED DATA LINES (no blank lines, no message headers/trailers (easily included by accident if you simply extract and append news/mail messages) in between. Also, all but the LAST line of a UUencoded file USUALLY starts with 'M' and has a length of I think 61 characters. This last detail isn't a hard-and-fast requirement, but is USUALLY true... and I may be wrong about the exact line length: it's one more than a multiple of 3, and is "around 60."

Hope this helps, phbill and all other would-be UUdecoders!

Chris is right, Bill - I you need to put the two UUENCODEd parts together
before you try to UUDECODE them. (This is just in case you didn't receive
my email to you on this subject).

From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <cwTmgB5w164w@cyberden.uucp>
Source record: 112282

I've finally started work again on Klix. I hope Missing Link and those
others at The POKEY Foundation (made some of the Expo91 demo segments..
like the first one with music) don't mind that I "borrowed" their music
(P.10.. just BRUN it, and then USR(44032). It was hella hard to
reconfigure EVERYTHING (Player/Missles, DLI's, Charactersets) around the
demo. I can't believe my system only crashed once! At one time, the DLI
overwrote some of the later notes from one of the voices. I thought I
was hearing things! Oh well.. I have the title screen (pretty
impressive, if I do use BASIC myself!... I mean say so myself...!), and
MOST of the screen set up for the game. I have the score boxes, and the
level box.. the Player Missle set (which, because I haven't worked on it
in a few months, I was amazed to see wasn't even loaded in memory! This
really sucks, as I have little space anymore to keep this thing in a
nice, 8k space (I usually try to keep stuff there, where I can >see< it!
:)) that the higher graphic modes take up). I hope that I'll be able to
draw some somewhat decent lines (at many angles!) using characters. I
hope this game will work out! I also hope to add "oh!"s and "ah!"s and
applause with the Parrot or the like. (I'll probably sample those off of
Wheel Of Fortune!! harhar!) Perhaps even a scream or a sad "you loose"
drone.. (ooohhhahhhh)
Welp... some day I'll finish this damned project...
ALONG WITH >30< THOUSAND other things I've started! (I like TurboBASIC..
I don't need to know exactly what "GOSUB 40" does.. I can understand
"SET_UP" and "TITLE"!!! :) .. Frank's a genius!)
pounding me little keys apart... BK

940. Video titling software

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-24 12:31:42 UTC
From: fontana@cis.ohio-state.edu
Message-ID: <1992Feb24.123142.12095@cis.ohio-state.edu>
Source record: 112279

Hi all,

I'm interested in using my 8bit for video titling. For the past couple of years, I've used a couple home-brew BASIC programs with ML subroutines, custom fonts, etc. Basically, I've got one program that fades text on and off with variable pauses, rates, etc, and a second that rolls an arbitrarily long (to 32k :) list of text up the screen in graphics 2 using fine scrolling. These are _OKAY_, and I've used them for some home videos, but I was wondering if anyone's done better, or if a commercial product is available that's any good.

I was imagining more colors (DLI's that scroll with the text?), or preferably, some nice high-resolution fonts in modes 7+ or 8. I was planning to extract the bitmaps for PrintShop's mode 8 fonts, but never got around to it.

Finally, has anyone had problems taping the composite video-out of their Atari? (I'm using an 800). If I plug the signal straight into my VCR, the color is much too harsh. I've been reducing the color through one of those video processors. (Poor man's solution is just putting a potentiometer in line with the video signal, but you'll lose contrast.)

Source record: 112280

On page 50 of the new Damark catalog there is a 20meg IBM compatible hard drive. What makes this drive pretty neat is that it connects thru the printer port. The writeup for this product states that for it to work it only requires 2.6K of mem for the driver. What I was wondering was wether or not this drive could be hooked up to an 8-bit thru the printer port in an 850 or p:r:? I assume all it would need is some patch to dos to redirect I/O from D: to P:. Or does anyone know if this drive (no manufacturer's name given) would be hardware incompatible with anything other than an IBM (I see no reason why)? If it is possible to connect this beaut up to an 8-bit it would be one HELL of a deal at $299 considering you wouldn't need to buy a controler, interface, etc.

I'd bet the driver uses the printer port's 8255 (IBM equivalent to our 6520 PIA's) under software control to handle the data transfers. I don't think there's equivalent I/O capability in any Atari printer port. The combo probably could be implemented if you added a second PIA to your Atari. Chuck Hughes has a file on Atari Base with intructions & you may be able to find a Micro Port. You'd also need spec's for the data transfers, timing, etc. The cost of the parts to add a 6520/8255 equivalent port to the Atari is only about $5. IMHO the real problem would be getting the source code/specs from the manufacturer.

I would be interested also. A few years ago I needed to do some
video titling, so I just whipped up a small BASIC program that would
just print stuff on the screen in Graphics 2, and then wait until I
pressed a key and moved on.

On a related note, has anyone had any experience with Genlocking? I
don't really understand how its supposed to work, but I thought I saw
someones comment on genlocking.

Source record: 112285

I have a question about my version of Kermit65 v.3.7. It states in the documentation that a VT100 keypad - (minus) may be performed by a CTRL-SHIFT-BACKSPACE. This does not seem to work in my program. All of the other VT100 keypad maps work, but this one does not work. Any suggestions/comments? I am using an 800XL with an SX212, Bob-verted; and I am using OPTION to bypass Basic upon boot.

947. 1027 Printer Nap

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-24 20:08:57 UTC
From: a.falcon@BITSY.COOPER.EDU
Message-ID: <9202241508.AA01626@bitsy.cooper.edu>
Source record: 112286

With all of the postings concerning the 1027 and the infamous
'printer/disk drive nap' syndrome... I dug up COMPUTE!'s June 1986 and
found the following information:
The Printer 'nap' does NOT occur on XE systems. The problem lies with
the operating system and was fixed in the XE computers. Bill Wilkinson
wrote an autorun.sys patch to fix the OS in this issue of COMPUTE! He also
says that the source code for the fix is in COMPUSERVE's 8bit SIG DOWNLOAD
section under utilities. The file is P1027.FIX and is an ASCII file.
For those who want to implement this fix, I suggest finding a copy
of this issue: it points out how to install it with AtariWriter and other
autorun.sys's already present (it won't overwrite your autorun).
Does this mean that the 1050/810 Drive doesn't take a nap after this
fix? ... I have no idea: He didn't mention that.
Mr. Wilkinson also points out that 800XL and all XE owners can
have more than 1 printer hooked up at a time: i.e. P1:, P2: etc...
Unfortunately, 400/800/1200XL's can't. Why? Not even he knows for sure.

Atarily,
Tony

948. COMPUTEREYES-Hard Drive Backup

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-24 20:19:58 UTC
From: a.falcon@BITSY.COOPER.EDU
Message-ID: <9202241519.AA01670@bitsy.cooper.edu>
Source record: 112287

A while back, someone was asking if it were possible to use COMPUTEREYES
software/hardware to backup a hard disk. In START Feb 1991, the DVT VCR
backup system was reviewed. It used a plug-in cartridge (into the ST cart.
port) to send video images of hard disk files to a VCR. The backup speed
was impressive: 20sec/megabyte. A '120' tape could hold about 36MB in SP mode
and 108MB in extended-play mode. There was mention to verification of data...
but it didnt seem an unstable medium to store data on.
At the time, DVT VCR was available from:
Seymor/Radix INC.
PO Box 166055
Irving, Texas 75016
(214) 255-7490
$99.95

Hope that helps someone out!

Apologies to the Newsgroup for using the Digest to answer personal coms, but be assured this traffic is in the interest of the community as Colin has volunteered to assist with the Mail Survey Campaign in the British Isles.

Colin, I forwarded your com to Jeff, he & I are both very enthused about your offer of assistance for the Campaign in the UK.

The procedure you suggested sounds excellent. I now know that airmail from my locale to the UK takes less than a week. If UK respondents return their replies to the Campaign USA mail-drop address also via airmail, the entire process will take less than 2 weeks. That's about as long as it takes in Canada/USA.

Please note that any International Campaign responses received at the mail-drop address before the cutoff date will still be included, even tho forwarding the card from the mail-drop to Jeff will result in their arriving several days late.
*** VERY IMPORTANT ***
Just today the decision was made to extend the cutoff date of the Campaign, partly to allow more time for foreign participation.

The new cutoff date is April 15.

A formal announcement to IA8 will shortly be posted, see that for details. Within a few days I'll be mailing you a batch of copies of Jeff's Campaign announcement with the new date. In order to save time it will be OK for you to circulate copies of the old announcement until you rcv the batch of new ones.

Many, many thanks for your kind offer of assistance, & welcome to the Campaign Committee!!

Warmest regards,

- BEN POEHLAND

Source record: 112290

We are now in the 7th week of the Mail Survey Campaign that kicked off officially on January 12, 1992 with the release to the Digest of the announcemnt from Jeff McWilliams.
Most of you will recall that in that announcement the termination date for the Campaign was March 31, 1992. However, Jeff has received a number of requests/inquiries from folks who felt March 31 was a little too soon. Also, the recent expansion of the Campaign to the international arena has brought with it a requirement for an additional allowance for foreign respondents.

After some consideration, the decision has been made to extend the Campaign for a couple more weeks.

The new cutoff date is: APRIL 15, 1992.

Campaign materials distributed beginning this week will reflect the new date.
Many thanks to all of you who have responded thus far. A *very high* percentage of the postcards returned have been checked off by people offering to write articles, software, etc. for Atari Classics, in addition to subscribing to it. I can't tell you how good that makes us feel! Every day it looks like an independent 8bit user-supported publication is an idea whose time is come!
Jeff is still preocupied w/exams, but hopefully he will give us some stats on postcard returns in a week or so.
You people are wonderful!

I'm not sure on this, but I think the PC can -read- data from the printer port, whereas printer interfaces for the 8-bit are not capable of this. The 8-bit can read the busy line, but I don't think it does much else. Still, over the years there have been several articles detailing how to make a printer interface for the 8-bits which plugs into the joyports. Since you can read and write data through these ports, and avoid sticky SIO calls, this would probably be the best course to take. There would still be problems, for instance, you couldn't boot from the hard drive without modifying the operating system ROMs. Getting good documentation on the drive might prove difficult; you could probably get by using a standard Atari DOS, just patching the calls to get configuration, and get/put sector. Further complications might arise if the sector sizes were different than the Atari's 128, 192, or 256 byte sectors. You would also have to write a specialized program to format the drive on the Atari (both high level and low level). It'd be a lot of work, but you could probably sell a few of them.

Re: demo techniques

Hi, this is what used to be Arun.. and still actually yurik.
What is APAC and colorview?
For a wavery scroll, we use a fine scrolling register for
up to 8 pixels movement, but for more.. this is the trick..
simply switch character sets. The Logo is drawn as a
character set picture. That is you are actually in text mode,
and the letters A-Z are on the screen. The look of the letters
is redefined into the image of the logo.
Then there is another character set, where the logo is moved
over by 8 pixels. All you have to do is switch character set
memory to the new location to instantly move the picture.
Combined with fine scrollying this works perfectly.
Glad to see I've inspired some technique discussion. It is
interesting and may even give me some ideas.
Someone said it was a waste of time making demos, and we should
be making apps. I find that offensive! I have made a demo,
and I think it is a new tech-artform that is pretty unique
to mostly 8 bits and the Amiga.. in fact the true of art of
demo making comes from the 64.
For me they are more than just fun to watch once.. as a coder
I like to guess the techniques used for the effects, and can
appreciate the work in it very well.
Also on the 64 the music is so good you can listen to it for
pleasure. I like playing demo tunes for background music,
I even make tapes of them. Some is quite good.
I have heard of 4bit rgb (4096 color) mode... let me guess, is
this just done by flashing through the 3 r,g,b scales?
It must flicker a lot.
Later all,
yurik@iris1.ucis.dal.ca
ps would someone send me some cool demos, I can write a little
hack to transfer joystick port to joystick port from my 64.

957. Das_Omen

I'm going to hope that Das_Omen.UuE and Das_Omen.DCm can fit on one 1050 enhanced density drive! Otherwise I'm going to say screw it! Why can't I get YAU from the archive? WHAT AM I DOING WRONG! SOMEBODY EXPLAIN TO ME (and please don't quote the BART help file, because that thing just confuses me.. I'm not using a Unix, and I don't want all the Unix terminology!) Sorry.. it's just I've called up this BBS at least 5 times today, and every time I've re-downloaded Das_Omen.UuE from my Mail box, and every time I either screw up the disk, or it get's Aborted by BobTerm, and deleted! AAAAAAA! Very P/O'd... Bill

958. Help with last details downloading from atari.archive!

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-25 04:16:11 UTC
From: hussein@psych.toronto.edu
Message-ID: <1992Feb25.041611.19700@psych.toronto.edu>
Source record: 112296

I am an old Atari user and I am very computer literate. That's what I
studied at school.

I'm having problems getting files from the archive. I've had some success
so far with the help of a fellow named Marek.

How I was doing it: ftp atari.archi.umich.edu, binary, get fn.arc, etc
quit (to my UNIX account). uuencode fn.arc fn.arc >fn.uue, kermit,
set file type binary, send fn.uue (then I escaped to the PC at work which
is set up for binary kermit transfers and issued a receive). After I'm
done I get out of my UNIX account. I then use util.exe for the IBM PC to
write Atari DD disks. I understand that the program is bugged in that
it won't properly write binary files even if you ask it to

util /w /b b: fn.uue

is what I now use. Don't ask me why I leave in the /b now since I am
no longer writing a binary file...habbit from before.

I have successfully acquired uudecode.bas, supunarc.com, diskcomm.com,
dskcom32.com. supunarc appears to be fine but it has one problem.
It indicates the number of SD sectors correctly but the corresponding
number of bytes is nowhere near 128*num SD sectors. In one case it
listed a file as being 4 SD sectors but being 0 bytes long. Is it insane
or is that just a minor display problem the program has?

I have not been able to get textpro working. Even a2at and at2a don't work.
They are written in C. Is there a problem with running them on an old
48K Atari 800 running DOS XL?

My system: Atari 800 (48K) and Rana 1000 SS/DD drive with DOS XL

Thanks in advance

Michael Mei

P.S. Again I am using my friend's U of T account.

I am mmmei@sunee

959. Introduction. MFM -> SCSI Question.

Greetinx,

Though I am new to the Atari net/mailing-list, I have been an 8-bit Atari user for at least 7 years now and have done quite a bit of programming and hardware hacking. Since this is my first post, I wanted to introduce myself. I am a computer science major at Edinboro U. of PA and have a strong interest in phsychology and Cognitive Science. One of my big programming intrests is fractals and I have written several such programms for the Atari as well as some VAX/VMS stuff. Well, Enough of that.....

I was wondering if anyone knew how to hook up a Tandon TM-503 15meg MFM hard-drive up to an MIO. I have heard about an MFM -> SCSI converter but I don't know anything about it. If I do get it hooked up; How would I format it for use with SDX. (My knowledge of hard-drive hook up to an Atari is VERY limited so any and all advice would be appeciated).

BTW- Anyone have any info on the graphics chip in the 7800 (MARIA ??)? I saw an earlier post where somone mentioned wanting to write some games for the 7800. Anyway, I am curious about the pinouts and such of that chip for 'possible' interfacing with an XL/XE.

Thanks.....

What?! You want to hook up a hard drive to you 850 printer port, which will
then serialize the data and send if over SIO at 19200 baud? Gee, it would be
as fast as an atari floppy disk drive. COUNT ME IN! NOT!

Maybe if you hooked it up to the joystick ports with a simple hardware hack.
But then, you sacrifice one of the 8 data bits to control Centronics
handshaking. But maybe you could use the cassette motor control line on SIO
for handshaking control, and use the joystick port for 8 data bits.

And you still need to write software to do this.

Gee, it's getting kinda complicated. Just go with the MIO or Black Box.

>assume all it would need is some patch to dos to redirect I/O from D: to P:.

As I understand it, the printer ports in the 850 and P:R: are strictly output
only, not to mention being controlled by the interface's CPU and ROM. Might
be possible to connect one of those drives to the joystick ports; of course,
you'd lose the use of your joysticks.

Tony someone (Falcon?) (a.falcon@bitsy.cooper.edu) writes:

> With all of the postings concerning the 1027 and the infamous
>'printer/disk drive nap' syndrome...

(Whcih I am at least partly responsible for starting...)

>I dug up COMPUTE!'s June 1986 and found the following information:
>The Printer 'nap' does NOT occur on XE systems. The problem lies with
>the operating system and was fixed in the XE computers.

Hm. I've never used an XE -- had an 800 for eight years then got a used
XL -- and have STILL NEVER seen the "nap" problem; either that or, as
I originally posted, I just always hit "BREAK" and it wakes right up again
and I can't believe I'm the ONLY person ever to try hitting BREAK...

> Bill Wilkinson
>wrote an autorun.sys patch to fix the OS in this issue of COMPUTE! He also
>says that the source code for the fix is in COMPUSERVE's 8bit SIG DOWNLOAD
>section under utilities. The file is P1027.FIX and is an ASCII file.

Is the file STILL on CI$'s 8-bit SIG Download section? '86 was quite a
while ago... is CI$ file retention THAT long? INFINITE?

> For those who want to implement this fix, I suggest finding a copy
>of this issue: it points out how to install it with AtariWriter and other
>autorun.sys's already present (it won't overwrite your autorun).

I'd like to see the original COMPUTE! article (Heck, I'd like to see
ANY or ALL of the material COMPUTE! ever printed about the Atari 8-bit; I
missed it all at the time), but my local library system (Rochester, NY)
has long ago stopped having COMPUTE! available even from their long-term
archives, as far as I've been able to discover... Would it be possible
to either type-in and e-mail me a copy, or photocopy and USmail it?

>Does this mean that the 1050/810 Drive doesn't take a nap after this
>fix? ... I have no idea: He didn't mention that.

It would depend on whether the "printer nap" and "disk drive nap" problems
are the SAME problem. I've never seen EITHER so I can't comment. Can
anyone here?

> Mr. Wilkinson also points out that 800XL and all XE owners can
>have more than 1 printer hooked up at a time: i.e. P1:, P2: etc...

Oh? And just WHERE and HOW is one supposed to CONNECT two printers to
an XL or XE? Every method of printer connection I'VE ever seen for these
machines, provides EXACTLY ONE printer connection PORT. It doesn't matter

if the SOFTWARE can support two printers (although yes, the very first release of the OS User's Manual made this claim) if you CAN'T HOOK THEM UP... I'd be interested in anything Mr. Wilkinson had to say on THAT side issue!

>Unfortunately, 400/800/1200XL's can't. Why? Not even he knows for sure.

Hmmm... maybe the XE has some mysterious "additional printer CONNECTOR" -- it's for sure the 400/800/XLs DON'T...

>Atarily,
>Tony

Likewise,
Chris

>set file type binary, send fn.uue

I've been Kermitting and UUdecoding for years without difficulty, and _I_
would have Kermitted the .UUE file with "file type text" (or FILE TYPE ASCII
or whatever your Kermit uses for "text mode"). A UUencoded file IS a
text file, that's the whole POINT of UUencoding.

>(then I escaped to the PC at work which
>is set up for binary kermit transfers and issued a receive). After I'm
>done I get out of my UNIX account. I then use util.exe for the IBM PC to

>
>is what I now use. Don't ask me why I leave in the /b now since I am
>no longer writing a binary file...habbit from before.

1) Try specifying the slash-switches on the UTIL command in UPPERCASE,
i.e. "/B" instead of "/b". It's stupid, but it makes a difference.

2) If you REALLY get stuck, note that the archiver/compressor utility
ZOO is available on both UNIX and the PC. Your UNIX system may already
have it (ask your system manager), and you can easily get it for the PC.
ZOO your raw binary FTP-downloads into an archive on the Unix system,
Kermit transfer the .ZOO archive to the PC in BINARY mode, then use ZOO
on the PC to unpack the original binaries onto the PC disk. For some
reason wrapping things up in a ZOO seems to help them survive the trans-
fer process better.

(For the record, I typically FTP in binary mode onto my old University
UNIX account, ZOO the files, transfer the ZOO archive with Kermit in
binary mode onto my Amiga, unZoo there, Kermit-transfer the resulting
file(s) in binary mode over a 9600-baud null-modem cable to my Atari,
and (if necessary, which it usually IS) un-ARC with Bob Puff's "Super
UnArc 3.2". Nary a problem.)

Occasionally somebody has screwed up in the process of putting the original binary files (e.g.) into the FTP archive, but I have yet to see that particular problem in the Atari archive specifically...

>I have successfully acquired uudecode.bas, supunarc.com, diskcomm.com,
>dskcom32.com. supunarc appears to be fine but it has one problem.

>number of bytes is nowhere near 128*num SD sectors. In one case it
>listed a file as being 4 SD sectors but being 0 bytes long. Is it insane
>or is that just a minor display problem the program has?

Haven't paid enough attention to know whether SUPUNARC has a problem...

I don't see YAU.COM on your list of utilities; it's a UUdecoder that's a lot faster than UUDECODE.BAS ... I highly recommend it (also its "companion" UUENcoder, YAUE.COM, if you expect ever to post some of your OWN creations...

>I have not been able to get textpro working. Even a2at and at2a don't work.
>They are written in C. Is there a problem with running them on an old

Atari and Lucasfilm made a lot of demos for the Atari 800 in the early
80's. Even though these programs may not have the true feeling of
"underground" software, they're quite stunning.

They were colourful, and very often they displayed incredible,
animated metal objects. There was a Lucasfilm game, Koroni's
Rift, that put the Atari's abilities to use.

Geez, I DO get depressed when I see folks asking questions about subjects
I strove so diligently to address during my tenure as 8-Bit
Editor of Current Notes Magazine.
Okay, for you guys still living in the Stone Age, in the November 1991
issue of CN there appeared a review by Steve Hoffee of a BRAND-NEW commercial
program from LJK called "Movie Credits".
The article was especially good because the author compared the new
program to a number of older progs whose place in the market is already pretty
well established, so it was almost a thesis on video titling in general.
Once again, for the deaf-&-dumb, here's the info for back issues:

Well, that would be me :-) No offense was intended.

I too enjoy graphics demos, especially those which are seemingly impossible. But I still stand by my original statement, that graphics demos are a diversion, not a boon, to the resurgence of the Atari 8-bit computers.

IMO, and bear in mind that I have done some tricky demo programming for the 800, demo writing has got to be the EASIEST form of programming. You don't have to worry about user interfaces, you don't have to worry about ease of use, you don't have to worry about playability, and so on. It is more a measure of hacking cleverness than artistic ability. (To use Chris Crawford's terminology: demo writers are Scribes while the world needs Authors.)

This is not meant to be a flame. Demos are fun and relaxing to write. But I do think that if people are looking for a challenge, then either write an application or write a game. The jump from a fancy animated onscreen display to a playable game is a big one, one which most demo writers seem to be unable to take. Go ahead, write demos, use them as prototypes. Just don't fall into the trap of writing ONLY demos...

The most popular SCSI-->MFM controller is the Adaptec controller, which
is numbered the 4000a and costs 89.95 from CSS. You then need a low-level
formatting program like HDPHFMT which will physically format the drive.
After that you need to partition in and format the partitions. I can't remem-
ber which program you use to do that, SDX says NOTHING about it, but
I think the MIO came with a disk with these programs on it.

Hope this helps.

Also there is a Video Titling that IMHO is excellent.
It's called - Video Titling Shop - from Datasoft.
It can be had at American-Techni-Vision for $14.00 or so.

This package can do fizzle,fade,blink, on text or background
graphics from micropainter. It also comes with micropainter
and a host of backgrounds, and fonts that are scaleable.

It can also do animation, and much more.......

Scott

972. 1027/1025 Printers

To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: 1027/1025 Printers

I have a vague recollection of the Wilkinson article Tony Falcone mentioned (IA8 V92 #55). I don't think it was actually an error in the XLOS. My understanding is that there was some sort of time-delay routine programmed into the XLOS, activated by ROM code in certain Atari printers (I think the 1027 was the only one that used it). At the time Atari's engineering designers were apparently very conservative, & feared DM print heads would burn up on long printouts. By having the printer activate the OS delay routine, which apparently involved some sort of semi-random generator, the OS would halt the printer at random intervals for a specified time period (256 sec?), to allow the <presumably overheated> print head to cool down thereby avoiding self-destruction.

The only problem is, Atari is Atari, & as far as I'm aware they never did incorporate the delay-activating ROM code in ANY of their DM printers (someone correct me if I'm wrong about that). But the ONE printer that didn't need it, they put it in! Voila, thus was born the 1027's infamous "Sleeping Beauty" syndrome.

Well before Bill Wilkinson's article, Gary Furr was already offering a 1027 driver that fixed the problem (I was a beta-tester). My guess is that Gary's/Bill's driver work either by disabling the OS delay routine or by cancelling the activation signal coming from the printer.

Once again, for folks interested in this subject, I recommend you read "Secrets of the 1027 Printer" in the Feb. 1991 issue of Current Notes. The info for getting back issues should appear elsewhere in this issue of IA8.

I'm not aware of ANY delay problems involving disk drives, but with the XL it is certainly possible that some non-standard DOS could inadvertently trigger the OS delay routine. I wasn't aware the delay had been eliminated from the XEOS, but if so it's a good thing.

Several people lately have inquired about the 1025 printer. It's an Atari XL-style printer made by Okidata (Japan), with an OKI sticker on the back! It's a 7-pin DM printer, w/out descenders, cannot underline or do graphics, not logic-seeking, & a little slow (50cpm?). I have one & use the hell out of it, it is printing virtually all the return labels for the mail survey campaign-3 or 4 thousand so far. It uses dirt-cheap simple typewriter-reel style ribbons. Atari's retail price on it in 1983 was $600 (!). I got mine from San Jose a couple years ago for $75.

Why bother w/such a plain-vanilla peripheral? Two reasons: 1.) The mechanism is rugged
& reliable; 2.) You can backscroll the platen by hand while the printer is turned on (while it's operating, even!) w/out fear of damaging the drive

electronics as can happen w/fancy Epson printers. This makes the 1025 ideal for the dedicated task for which I employ it: printing labels. A mailing label doesn't have to look pretty, it only has to be legible. And since the document being printed (label text) is so short, the slowness od the 1025 isn't a big problem. Using LabelMaster, I set up the 1025 to do 200 labels, then go off & do something else. It is so utterly reliable, I don't worry about it jamming, etc., as has occurred w/other printers I've used.
The 1025 is direct-connect via the 8bit SIO (no interface required), & has built-in friction & tractor feeds. Best Electronics carries TONS of spare parts for the 1025.

>as fast as an atari floppy disk drive. COUNT ME IN! NOT!

If you have used SIO2PC, you'd know that the speed of the atari drives
isn't really limited by the 19.2K sio, just stupid drives (IMHO).

>_Maybe_ if you hooked it up to the joystick ports with a simple hardware hack.
>But then, you sacrifice one of the 8 data bits to control Centronics
>handshaking. But maybe you could use the cassette motor control line on SIO
>for handshaking control, and use the joystick port for 8 data bits.
>And you still need to write software to do this.
>Gee, it's getting kinda complicated. Just go with the MIO or Black Box.

Everybody always wants to use the joysticks. Why can't the parallel
bus be used? I bought a $1.50 connector and some ribbon cable, and
have done some simple experiments with it. I don't know how well
documented the OS support for the bus is, but I was able to figure
quite a bit out from just looking at the schematics. Anyway, I'm
kind of wondering why the PBI isn't used more by hackers.

I'll admit that software to run the drive mentioned above would
probably be a trick. The manufacturer may not be willing to hand
out all the info you'd need (if you can find them).

Just my opinions.

(BTW: my last name is Kendrick.. isn't it on my trailer?)

Well... the major problem that got me (it probably would've worked if this didn't happen) was the 1st uudecoded part was corrupted. I got another copy, but by God, it still won't fit on one disk! It may be I have just a little too large of a header. I fooled with the uudecoder to make it ASCII recognizing, but it was FAR too slow, so I tried my hand at a [13][10] to [155] conversion program... I THINK it would've worked.. it was working up until the point when I tried to SAVE it (before I did the final analysis!) and the disk was too full.. then the program caught it in a TRAP to the open sequence, and just sat there BEEPING! When I hit [RESET], all I got was a cursor and no response to anything! I HATE that! Oh well... my disk i/o must've screwed it up. After that I lost my ASCII version, so I REdownloaded (AGAIN) the mail (and remembered SHIFT for conversion on BobTerm!) and AGAIn tried uudecoding it. Does it need two drives? I think I only have a few bytes missing..

Here's what it does when I boot:
loads, screen goes black, says "A: OMEN".. no response.

I directory the disk and see "OMEN.COM".. I [L]oad it, it loads, I see a title screen, hear one drum beat, and then it freezes.

So? Could SOMEbody be kind enough to tell me HOW to use BART!? I need YAU pretty badly, it seems! Thanks... Bill

> my email to you on this subject).

Well.. like I said (I think), the uudecoder decodes both the files ok.
It's DiskComm3.2 that won't handle it. The FIRST file is corrupted, the
SECOND file isn't a .DCM, or so says DiskComm, so I'm assuming that if
the first file had no bad bytes, the appended (total) copy would've
worked out ok. Oh well.. now all I need is a better uudecoder (or a
bigger disk drive!)

Well.. my friends and I made a movie, and are planning two more. On the first, we used the computer (in a very foolish way.. video taping the screen) (BTW: this was a 400, so I didn't have much of a chance for anything fancy) to fade text down the screen (ie. starring would light up, then then names 1 by 1). But, then I decided something better's needed for the next movies. I made a little fine-scroller as well (ALL in BASIC, no ML) and it works reasonably well (at a medium speed, I think slow looks a bit skippy). Then I decided to use a multiple-DLI to make the text "fade" as it gets higher up the screen. Perhaps you might have interest in it? (I'll need a uuencoder first, or to rid it of all CTL characters and inverse and such (ASCII's sooo weak!))

I agree with Todd Greenfield about the parallel bus. It is one of the least understood and yet the fastest and most capable connectors ever designed into the Atari XL/XE systems. Amazingly, from what i understand, both the Black Box and MIO use it sort of illegally. The Parallel BUS is supposed to be able to support up to 8 different devices, each of which can load in its own handler code and stuff. Wheras the MIO and BB both hog the Parellel bus all to them selves. This is what I understand. But I know extremely little about the PBI,
So somebody at ICD or BOB PUFF will no doubt be correcting a few assumptions I'Ve made about all this. This is why I asked if anybody knew of 800XL OS source code from Atari. But no one responded. Commented source code for the Operating System Parallel BUS routines could reveal a lot of secrets about the parallel bus and how it works.
The parallel bus has a
lot of power behind it that if properly harnessed could be made to do amazing things. Look what the Black Box can do: Parallel Port, SCSI/SASI port, RS232 port, Floppy Drive port, graphics dump, monitor/debugger. It's a truly amazing piece of hardware.

The PBI is really easy to use just as a plain jane section of the 6502 memory map. Address in a couple PIA chips and you can do tons of stuff with it. I am currently tired of the slow speed of the P:R: connection's Parallel Port. I have a external 256K printer buffer, but it waits and waits for the SIO port to send it data. I am too poor to afford the Black BoX at this point, so I am gonna build a simple Printer port. It'll cost about $15.00 at the most.

The 1090XL was supposed to be a card cage that plugged into the Parallel BUS allowing multiple cards to be plugged into it with ease. If anyone has one of these, or can get me schematics, I would greatly appreciate getting my hands on the design, to see how it was done, and maybe make some sort of custom backplane of my own for the PBI.

Here's a couple more ideas. Someone mentioned the 7800 graphics chip. Why not wire it into the parallel bus? How about wiring in a 68881 coprocessor, and rewrite the OS floating point routines to talk to the 68881. Can you imagine the speed increase that could be realized? How about hooking up one of those handheld image scanners to the PBI?

Lots of neat stuff that can be done with the PBI, and the Atari 8 bit!

Jeff McWilliams

> (the 18th Count!)

Yeah...but I still think DangerMouse is better...that's why handle is Penfold.
Actually, someone made a game Count Duckula for the Atari ST...I have it, but
it's kinda stupid.

I tried making a DangerMouse game (and a Doctor Who game for that matter) a
while ago...but got discouraged when I couldn't draw a good Penfold or DM.
If you've done something nifty, I'd love to see it!

Do you know if DangerMouse is back on the air? It was for a while...with some
newly done 1990 episodes...but after about two months, it's gone again...at
least at 7:00pm EST.

Did you know there was a Count Duckula comic book a few years back? I bought
the first issue...but none of the others...in the comic book he was actually
evil (if I recall correctly)...just like he was in the DangerMouse episodes.

I don't know of any new Duckula episodes being done...

This was the way I was thinking when this thread started. Design a
simmple interface, and load the driver off of floppy. (Unless you wanted
to put the driver on a cartridge or something, then you could boot off
of the hard drive.)

The reason for not using a MIO or Black Box is the simple fact that
it is too expensive!! I can't afford to put that much money into my old
8-bit.

> I'll admit that software to run the drive mentioned above would
> probably be a trick. The manufacturer may not be willing to hand

Since the driver only uses 2.6K, any knowledgable IBM person
probably could dissassemble it and figure that stuff out on their own.
On the other hand, since this was a Damark catalog, it could be a
discountinued item, and such wouldn't be worth all the trouble.

I can think of one thing that makes the 600XL better than the 800XL.
Its size. A 600XL (with built-in 64k upgrade) occupies less space on
the desktop than an 800XL.

No, I don't think we're communicating here, Bill - you need to PUT THE TWO UUENCODED PARTS TOGETHER BEFORE YOU TRY TO UUDECODE IT AS ONE PIECE. You do NOT uudecode the TWO files, you only uudecode the ONE combined file. THEN you run DiskComm on it. It's not surprising you're getting the errors that you are - DiskComm says the first part is corrupt because it's only the first half of the file, then it says the second part is not a DiskComm file because it doesn't have the first part which holds the header information.

I would like to see this when you get it finished. Are you going to
write a new P: driver for it then? (BTW, I do now have an EPROM burner,
so a new OS could be burned with the driver built in.)

More than one Atari printer may be daisy chained with the rest of a system as long as they are different printers. The XEP80 manual lists which Atari printers respond to which "Pn" numbers where n is some integer. Unfortunately, I've misplaced my manual but I do remember that I had my 850 (P2:) and 1020 (P5:) connected to the 800XL at the same time and could print to the proper one if I specified P2: or P5:. The trick is that all printers respond to P: and if one attempts to print to P: he will receive some nifty SIO errors as a result to all printers responding to the computer. As far as I can tell, all software on the face of the earth uses P:.

I found myself specifying P2: or P5: for an output device whenever possible (DOS or BASIC or ...) or else taking the Epson off-line or powering the 1020 down. {At least I didn't have to swap SIO cables :^).

Colin,
Ack receipt of address from UK, have forwarded to Jeff, kit will go out tomorrow.
Upon advice of new sysadmin here I sent you 7 test msgs, 3 bounced, did you get any of the others? Will include hardcopy printouts of bounce msgs w/shipment of revised PR's this week; perhaps they will offer a clue to the com problems here. New sysadmin claims to be expert, I have my doubts! Mike Jewison reports failure at com attempts to you from his locale; am trying everything, nothing works. <Aaaarrghhh!!!> Still rcving you OK, tho.
I know Sprint has some kind of installation at Reston VA. Can you furnish a name/phone # of someone there I can contact? (If that would help.) As per previous efforts last year, frustration levels now entering non-linear response regions.
Apologies to the Net for conducting Campaign business thru the Digest, if we ever establish 2-way coms we'll quit doing things this dumb way.

989. Seeking for the roots

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-26 19:54:00 UTC
From: UJ1G@DKAUNI2.BITNET
Message-ID: <"92-02-26-11:54:12.08*UJ1G"@DKAUNI2.BITNET>
Source record: 112223

Sometimes you are asked by other people about the computer you use.
When you tell them 'Atari' they for sure think you use an Atari ST.
That's why I always explain: 'I own an 8-bit Atari, not the ST' but
they still don't know what the heck I'm talking about.
Most of the people I know are Amiga or PC/Mac/ST user. Some of them
still remember the good old days when the whole family gathered around
the TV-set in the living-room and admired the young freak in front of
his 8-bit computer. Most of these die hards owned a C64, a VC20, a ZX8 1
or whatever else. Sometimes one of them remember to have heard about
the 8-bit Atari. Then he tells you: 'Oh, the character set of your Ata ri
looks similar to that on my ancient C64, Atari must have pirated it fr om
Commodore'. When I tell him that the 8-bit Atari was out _before_
developers even bothered to dream about a C64 he just doesn't belive m e.

The thing is I don't know much about the first days of the greatest
computer ever built. If I knew some facts about it I could tell those
guys the truth.

Maybe somewhere outthere there are some die hards who know about these
secrets. It would be interesting to know who developed the 8-bit line,
what was the first magazine covering it, who was the programmer of
the operating system, how much did the first Atari cost, who came up
with the idea of installing the ANTIC, who the heck designed the
character set and many many other things from the beginning of the
ATARI 8-BIT history.

waiting for your secrets...

You can be sure, it doesn't work no matter if you use /B or /b or
/w /b or /w /B or /W /b or /W /B or whatever. I've tried all of them.
The only way to get through is uuencoding your stuff while using
util.exe.

Source record: 112241

4096 colors.... well.. Jeff Potters first attempt (or so he told me)
did flicker alot, but then he took the 16 shade mode, and colored it
downwards on the screen. The display-list (if you don't understand what
it means, it's pretty much HOW it sounds) would change the colors down
rgbrgbrgbrgb... etc. Then, he would VERY quickly change to the next
screen, and the colors would be gbrgbrgbrgbr... (moved one), and then the
third screen, and the colors'd be brgbrgbrgbrgbrg...

APAC is a 256 color mode, using the computer 16 color and 16 shade modes.
One would do a lot like the about (ColrView) by having 2 screens, color
and b/w, and then flip between them and their modes to make a 256 color
screen (I haven't seen this, or ColrView, but they sound impressive).
APAC in the older versions would just force the computer to alternate
modes. If you look closely, you'd see how the screen is made of bars of
color, and bars of greys. I made a demo once, that'd draw 16 shades
across the screen, then force the computer to change the colors 16 times
down the screen, and it looks pretty cool. But in APAC using alternating
modes (which, BTW, reduces the res from 80x192x256 to 80x96x256), all of
the bright "colors" would be ruined by the white lines in between the
very dark color lines.
Awesome demo has a nice 256 color apac 80x96 kalidescope (with the best
music of the entire demo) that looks really .. well... awesome (excuse
the pun!... but I didn't name the thing!)

Thanks for the ideas on the wavery-scroll. I MIGHT try that, but a
cooler way'd be using a DLI to not only change colors (make it look
silvery), but to rotate the horizontal scroll register down the DL
(0,1,2,3,4,5,6,7,8,7,6,5,4,3,2,1,0,1,2,3,4,...) and then have IT move
(1,2,3,...2,3,4...4,5,6...)
I think I'll try that later. I might possibly need a better DLI handler,
as the one I have will change only seqential places in memory
(708,709,710,711,712.. the colors.. I think I once made it start at 704
and go to 712.. perhap's I'll forget the color control and just go for
waving!)

thanks again for the tips and stuff... c-ya!
phbill

Ah... didn't notice that "true art... from the 64".

That IS true.. what's even MORE interesting is that all of the hacked 65
(64) games and such I've seen have better "I hacked this, I am GOD!
Greetings to ..." DEMO's beFORE the game than the GAME ITSELF!...
fortunately, most of my newer games I have rival those demos! (HAR!)
(and no, I don't have (m)any hacked games.. perhaps Zybex is, but I got
that from ATARI's BBS, so I think they might've taken it off if it
were...??)

I saw a message mentioning that a Supra Modem 2400 could be had for $190.00. This price is quite high. If anyone is interested I know a small computer supply store (fairly local) that has the same modem for about $75-$80. If anyone is intersted, I will attempt to dig up some more info.

BTW- it has a has a full set of LEDs, phone in/out, and a DB25f rs232 port. It would work with any Serial Interface.

> Jeff McWilliams

I doubt that the 7800 Graphics IC could be interfaced w/ the PBI because it would be like trying to do the same with the GTIA whose output is not just pure digital. A friend and I are thinking about ways to interface the 68881 w/ the XL/XE machines in any way possible. The PBI way may be ideal for this. The PBI handlers may even save the trouble of trying to address the 68881 internally. (I wonder if It could be mounted internally, yet still be accessed through the PBI ??) I think the OS could be easilly modified to handle the co-processor, but there is software out there that uses the FP registers for its own purposes. I wonder if this would produce some kind of conflict???

Anyway, Neither one of us actually have a 68881 to experement with. Could somone please let me know where I could pick one up with a full data sheet?

Thanks a lot......

BTW- Jeff, Thanks for the info on the MFM/SCSI conversion. I think I can pick up Adaptec 4000a for about $60 or less. I am still not sure what formatter to use, there are a lot of them out there. What are the differences? Oh, The image scanner sounds like another great project. Too bad I don't have the money to buy all of these cool toys to experement with :-(

>
> I can think of one thing that makes the 600XL better than the 800XL.
>Its size. A 600XL (with built-in 64k upgrade) occupies less space on
>the desktop than an 800XL.
>
> Anders Skelander

Yes, and even after you add the Monitor upgrade,and a 128K upgrade
it will be easier to fit in say, a Tower case or something,
than any other 8 bit would. And you can still hook up your Black Box
or MIO and run hard drives, and floppies, and everything else.

I just wish you could go beyond 128K with it. As it is, it is too small
almost. typing on it seems to really hurt my wrists, and of course the
keyboard isn't too hot either. The 800XL is a little better, but
still I am enjoying my 1200XL while my 800Xl is down, the keyboard
is so nice, even almost as good as my IBM keyboard hooked up to my
800XL.

Ryan,

I agree! I will start off with a software driver for the P: connector, then later probably modify my OS when I finish the Eprom Burner, so that even programs like Print Shop will work with it. this is what Atari should have done with the XEP80, as it stands, you can't take advantage of its printer port for just that reason, you have to load in the driver, and even some programs you load from DOS don't like the XEP80 handler. Another idea I had, was that since the Parallel Bus can load in code from a PBI device, why not just sit a little ROM out there, with a rewritten XEP80 driver. That way, on boot-up, the driver already gets loaded in from the PBI ROM, telling the OS to use the XEP80 display and printer port. It still wouldn't work with SpartaDOS X, as they wrote the silly thing to poke screen data directly to memory, which they shouldn't have done. With all other DOS systems should work great.

All you should have to do to your 1200Xl is purchase an 800XL OS ROM,
and then do a modification to the 1200Xl to accept the 27128 type
ROM/EPROM device instead of the two 2764 chips it currently uses.
I have done this, it is yet another of Bob Woolley's great hardware
projects. In fact I have had my 1200XL running the 800XL OS, the
Newell Omnimon Xl chip, and the Omniview 256 chip in there.
Works fine. Oh, I also installed the internal Rev. C BASIC chip in
my 1200XL. No problems.

There is little the other XL/XE systems can do that the 1200XL Can't.

That must be where my problem lies-- haven't looked that closely at an actual ATARI printer, per se. I take it they have TWO SIO ports apiece, then? (The only printers I've ever seen driven off an Atari 8-bit are third-party Centronics-type printers driven off the 850, hence my one-printer-per-system impression. My apologies. (Say, what's to prevent us from modifying some 850's to respond to different IDs in some manner, then hooking up several of them to a single CPU? Imagine having a whole slew of modem ports... can you say "multi-line BBS?" (just don't ask ME to PROGRAM it... ;-))

> The XEP80 manual lists which Atari
>printers respond to which "Pn" numbers where n is some integer. Unfortunately
,
>I've misplaced my manual but I do remember that I had my 850 (P2:) and
>1020 (P5:) connected to the 800XL at the same time and could print to the
>proper one if I specified P2: or P5:.

Wow! This is absolutely NEW information to me, and I've been in this game for over ten years now! Is this information documented anywhere ELSE? (I assume it HAS to be, else how would the XEP80 manual writers have found it?) Does one have to have an XEP80 in order for this to work? I'd like to see the complete list of "printer IDs" if anybody has it and can post it.

> The trick is that all printers respond
>to P: and if one attempts to print to P: he will receive some nifty SIO errors
>as a result to all printers responding to the computer. As far as I can tell,
>all software on the face of the earth uses P:.

Most software ought to be more-or-less amenable to "patching" to take ad-vantage of the Pn: syntax...

>I found myself specifying P2: or P5: for an output device whenever possible
>(DOS or BASIC or ...) or else taking the Epson off-line or powering the 1020
>down. {At least I didn't have to swap SIO cables :^).

That works too! :-) I can hardly wait to dig out that old 1020 I've never really used, and hook it up as a second printer... :-) :-)

From article <28994@darkstar.ucsc.edu>, by (Stephen Wayne Miller):
>
> As I recall, Mr. Price is the author of the Antic Music Processor.
> __
Perhaps the confusion is the fact that the initials (AMP) are the
same but Mr. Price did not write the Antic Music Processor. I am
not familiar with Mr. Price's work, but I have used the Antic Music
Processor a lot. In fact my son just finished putting in 'Imagine'
by John Lennon and I am adding the Lyrics for him.

Antic Music processor first appeared in the Dec. 1988 issue of Antic.
The program V1.2 was on the disk-of-the-month. Antic ran a contest
to get readers to submit their favorite songs edited using the AMP and
they (the winners) were included on the June 1989 Antic Disk along
with AMP V2.0 which added the ability to edit lyrics. There was
also an article in the June issue of Antic.

There was some AMP songs on the Disk-of-the-month for several months
afterwords depending on space Antic had. The August Disk had the
last version of AMP (V2.1) that corrected a bug I think. There was no
article in the magazine and I was just lucky that I got the disk with
the magazine.

According to a short blurb that accompanied the June 1989 article, the
author is Steven Lashower. At that time he was a CS student at Cal.
State Univ. at Fullerton (CA).

That's all I know except that I consider the ONE program that enjoyed
most on my 8bit Atari.

> are the SAME problem. I've never seen EITHER so I can't comment. Can
> anyone here?

The only nap I know, both using the 1027 and my 1050 disk drive, appears
sometimes while hacking on the keyboard during I/O operations.
Everything just stops, loaded programes wouldn't load, the printer
wouldn't print. The only way to make everything working again is to
press the BREAK key. Then every suspended operation goes on.
(Everything is hooked up to a 130 XE)

> Oh? And just WHERE and HOW is one supposed to CONNECT two printers to
> an XL or XE? Every method of printer connection I'VE ever seen for these
> machines, provides EXACTLY ONE printer connection PORT. It doesn't matter
> if the SOFTWARE can support two printers (although yes, the very first
> release of the OS User's Manual made this claim) if you CAN'T HOOK THEM
> UP... I'd be interested in anything Mr. Wilkinson had to say on THAT
> side issue!

It's no problem to connect two or more printers to an Atari 8-bit,
assuming you want to connect Atari manufactured printers like
an 1027 or 1020. They have always two jacks on their back where you can
plug in the serial cord (same as your diskdrive 1050).
I've both the 1027 and the 1020, so just for the hell of it
I've connected them together and switched on the whole equipement.
Then I started to print some text. What happened? The 1027 printer
(which was closer to the XE than the 1020) started to print while
the 1020 did nothing. After some lines of text had been printed
without problems I got a mysterious error (don't ask me about the
number) and the party was over.
I wonder how could be possible to destinguish the printers while
printing to the 'P:' handler. How does the computer know which printer
is number 1 and which is number 2? You don't have a switch to determine
printer adresses.

(just some thoughts)

> the roll that's supposed to keep tension in the tape lost its grip
> and chewed the tape. I still believe that to cure a bad 1010 you don't
> need a computer repairman - you need an exorcist.

My 1010 always worked without chewing tape, the only problem are the
buttons - they always break, so you have to open it and use some
glue. I had a chance to use the XC12 recorder for a short time as well.
I think the 1010 is better. It isn't possible to rewind tape with your
computer turned off using the XC12 - you can do it using the 1010 due
to it's own power supply. The 1010 seems to have less problems with
tapes that don't forward smoothly, it moves your worst tape while the
XC12 doesn't.

have fun!!!!

1013. Recursive Action!?!?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-27 21:36:07 UTC
From: swoodwar@zeus.calpoly.edu
Message-ID: <1992Feb27.213607.172328@zeus.calpoly.edu>
Source record: 112105

I need to write a simple recursive program for my senior project. I could just do it with Mac/65 but that would be a pain. So I tried it with Action, and it didn't work right.

It seems that Action can't properly handle a procedure that calls itself. I think the problem lies in how procedures allocate their variables, but this is mere speculation.

Can anyone confirm this? Reply or post if you think it would be a fun thread.

Dangermouse? That show's ok. Sort of repetitive. I'm into eviler
things, though my favorite character is Nanny.. but then there's Igor.
I think DM has too many pun's in it and CD, especially being newer, has
much higher quality animation (sure, DM had the groovy flying car scenes,
but they all looked the same in every episode!) Puuurrr 'aps I shall
make both games, as I can see a DM game much more easily that CD. As for
DM being on, I think it's on Sat and Sun mornings, about an hour or 1.5
hours after CD. (CD is at 8? 8:30? 8 I think..)
well.. catchya later... Bill

You said "WHERE and WHEN would you have 2 printers hooked up?".. I have 2 printers. 1 busted Okimate 10 thermal color printer, and one totally thrashed (destroyed cover and roller knob) xmm801 printer. My O10 broke a little over a year ago... I think it's the "plugnprint" thing.. it sends "I'm here!" to the computer, but never prints anything...

I used my 1010 for at least a year or two before I did major work with a 1050. I still use the 1010 to play music when I do stuff every once in a while.

It'd be quite interesting to see a NEW OS for say a 16bit CPU or something.. then don't include ANY C: driver of any sort! (the sound-in and of course the always used SIO motor control had better stay, but the rest of it can go.. it seems there's more stuff on C: than D: in DeRe!)

Message-ID: <699258802.F00001@tdkt.kksys.com>
Source record: 112112

Can anyone give me any tips or
information on using a VBI? I am in
the process of making a game and
would like to know how there used
in most atari games. The language im
using is Action! and im having some
problems with using a VBI and timing
the rest of the program with VCOUNT.
Interupts im general are new to me
and there's alot of details to them.
I cant help to feel I should use a
VBI but im not sure if its all that
necessary. It seems that most games
use them. If I had a disassembler
that I knew how to use, I suppose I
could look at other programs to see
how there done.

I'd apreciate any help. thanks

?

Does anyone know how to use
A disasembler?(Codebuster in
particular) What exactly is a
'vertual' address? I have some idea
of what it is but not anuf really.
Also, Why does 'Codebuster' or any
other disassembler have to prompt
you for run and init addresses all
the time? I know why actualy but
how am I supposed know the run & init
address? Programs are usualy loaded
in little segements which confuses
me more(And again I know why but I
just wish things were simpler)
If anyone can help I'd really
appreciate it.
BTW: does this message show up
in 40 columns?

It's been awhile since I did it, but if memory serves me(?): All calls to procedures are done by passing the parameters through the registers[A,X,Y]+ page zero at about $A7 or so. The way the proceedures are called is by JSR to the routines address so my guess is you're seeing the stack wrap around to point to a meaningless return address BTW: RETURN in Action compiles to $60=>RTS. What you may want to try is putting a code block in that'll clear the stack i.e.

```
PROC Recursive()
BYTE Pass=[0]
IF Pass<>0 THEN [104 104] FI
IF Pass=0 then Pass=1 FI
DO
(yourstuff)
UNTIL ??? OD
RETURN
```

Aboslutely true that in strict terms, Action! is not a recursive language.
The trouble is, that unlike real recursive languages, when you compile an
Action! routine, it is compiled ALONG WITH ITS VARIABLE space into one static
place in memory. So if you call a routine from itself you can easily overwrite
the variables of the top-level calling function.

Message-ID: <55105@cup.portal.com>
Source record: 112132

Some guessing, but the thing probably loads the code into any free space regardless of where it really goes ergo virtual. Since most programs have redefined character sets/data the program has to know where to start the disassembly or it could produce garbage trying to work on a character set. Most(?) programs use the INIT vectors to put up the intro screens, check for copy protection, etc. It's a GREAT feature. The way to find them is get the 1st 6 bytes from a binary file, it'll be something like:
255 255 00 06 222 06; 255 255=>binary file 00 06=>start of load 222 06=>end. This=>223 bytes (or whatever). Read the next 223 bytes, then see if there is any more data in the file. DOS assumes that if it did not reach EOF [136] that the next 4 bytes are another load address. If it loads at $2E0 it's the run address, $2E2 (226 02) it's the INIT address. It could be something like 226 02 227 02 =>load two bytes at $2E2. DOS checks these location for non zero values. If they change then DOS does a JSR to them. For the example, the values following the 226 02 227 02 would probably be 00 06 or something within the address of the file just loaded.
BTW: 40 columns.

I am posting this mail reply as requested by the sender:

---------- Begin Included Text --------------------

Date: Fri, 28 Feb 92 12:34:54 -0500
From: slackey@BBN.COM

On my last major development, I tried a different programming technique. What I did was allocate most of my 1/2 of page zero as a locals stack. I used the page-zero offset-off-X addressing mode to read or write these variables. and added to X when doing a call, and subtracted from X when doing the return. Anytine I HAD to use X for something else, like when doing I/O, I saved and restored X around the CIOV call.

This worked out nicely for sending values to a routine, and receiving a result from the routine; I would say put values to be passed to the routine at 5,X and 6,X; add 5 to X (actually call a subr with 5 inx'es in a row and a rts) and jsr. The called routine would thus find its inputs at 0,X and 1,X. It could place return values in 0,X and 1,X and return; the caller would then dex 5 times and use the returned values in 5,X and 6,X.

This would result in a nice way to handle recursive routines, although I never needed it in my program.

Actually, what I REALLY did was define this "argument stack" as 16-bit variables, and used the notation R0, R1... to indicate which 16-bit value to use. I defined R0 to be 0, R1 to be 2, r2 to be 4, etc. I wrote a LARGE NUMBER of macros that almost let me program the thing as a 16-bit processor. For example, the macro

addw s1, s2, s3

is defined as:

```
clc
lda %1,X
adc %2,X
sta %3,X
lda %1+1,X
adc %2+1,X
sta %3+1,X
```

Unfortunately, it's pretty tough to make this style work for the varieties of addressing modes. So I ended up making lots of variations of the macros, some to allow s2 to be an absolute location,

etc.

I also wrote a runtime library, so I could do stuff like -

LOAD R0, <address of string>
LOAD R1, <length of string>
PUTREC #0

to put a line on the screen. The LOADs would be expanded by macros,
and PUTREC is expanded as a macro to load the channel # into A then
call the I/O library entry point for putrec, which puts R0,X and R1,X
into the IOCB and call CIOV.

BTW, for some reason I cannot post to the net right now, and would
have preferred to post this. If it is easy, would you mind posting
it for me?

Bill, the Turbo816 board comes with its own Operating System, which is mostly standard XL operating system, with some memory management routines and miscellaneous stuff in it. You can't totally change the OS because then older software wouldn't run.

1036. Free page 0 (today!)

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-28 20:27:43 UTC
From: hship@teton.sw.stratus.com
Message-ID: <998@transfer.stratus.com>
Source record: 112012

I've been putting together a few utilities in assembly to be called
from BASIC using USR().

Anyway, as usual, the crunch is for free page 0 space.

I need temporary use of memory on page 0, at least 6 or eight bytes.
More would be better, because I could store additional variables there
and shrink my assembled code more.

Anyway, "Mapping the Atari" talks about this, but says that a USR
routine can use FR0 (floating point register 0), which is 6 bytes
starting at about $D0 (from memory).

It seems to me, though, that I should be able to use the remainder
of the floating point space on page 0, $D0 to $FF, using the same
rationale that allows me FR0. Did "Mapping" describe this wrong?
Can I use the remainder of precious page 0?

Second part:

I'm using Synassembler, and its bugging me that every time I do
an new .OR it closes the current .TF file. What I'm writing will
eventually be an AUTORUN.SYS file loaded into low memory (at $1CFC),
and I want to:

```
END.OF.CODE
.OR MEMLO
.DA END.OF.CODE
```

so that it moves MEMLO up above my code. However, the .OR MEMLO
closes my .TF file (as I said). I end up using a short BASIC
program to merge the two parts together. There must be a better way.

>
> PhBill: Bill Kendrick UseNet: moon!cyberden!phbill@well.sf.ca.us

Hey, that sounds like a great idea. The only problem is that B/W camera
must be used with RG&B filters for each image so only the proper wave-
lengths of light are processed for each image. I believe those kinds
of light filters are a bit expensive (you'll have to talk to a photographer).
Keeping 3 images lined up may be kind of tricky, too.

I am currently trying to modify a Mandelbrot Set generation program I wrote
To generate RG&B screens to be used with ColorView. I have a couple questions
though:
1) How are ColorView screens set up? (i.e. Is there a screen of red,
screen of blue, and a screen of green OR do the colors alternate using DLIs
or each line. I saw mention of it before, but was still unsure about it.
BTW- What is the latest version of ColorView).
2) Is there a Version of CV that will work in Gr. 8? This should allow
8 colors w/ 320x200 rez.

Message-ID: <00956D9F857D5960.20604138@edinboro.edu>
Source record: 112134

I just thought I would let everyone know that I called ReeveSoft today. (right after I read your first message, Jeff). I found out that He no longer works with the 8-bits! (He has _moved on_ to the IBM world). They no longer have any Atari stuff in stock. (Mr. Reeve was the maker of the Diamond GOS stuff).

Does anyone happen to have the Diamond GOS 3.x Cart.? I really want to play around with one. If anyone has one to sell, I will buy it, (at a reasonable price, of course :-). I started working on a GUI shell for SDX a while back and I am curious as to how the window routines were done in GOS.

Peace,

Adam J. Conover | Home: 90 Plum St.

1039. Adds posted earlier

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-29 02:24:23 UTC
From: prkeen@nuchat.sccsi.com
Message-ID: <1992Feb29.022423.14406@nuchat.sccsi.com>
Source record: 112135
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale,misc.forsale.computers,tx.wanted,tx.general,tx.forsale,houston.wanted,houston.general,houston.forsale

This last week, I have posted for sale adds for my Atari 8-bit equipment with
my work phone number over several networks and on SEVERAL non-networking
BBSes. The equipment is still for sale, but PLEASE DO NOT call the number
in the add. I wasn't even thinking correctly when I did it until I got
suspended for a day for doing personal business at the work place. 2/28/92 is
the day I got suspended due to that reasoning. If you call me at work, you
will not get in touch with me because my calls are going to be screened if they don't
terminate me first. You can
leave me e-mail on the HACE BBS at 713-458-9923 to user #38 if you have
any questions about my 8-bit equipment. I am so sorry for the inconveniences.
It was just a matter of several little mistakes of 1) Not paying attention to
the work rules, 2) Not thinking first before posting my work phone number,
and 3) doing things I'm not suppose to do. Well, hope you understand.
Phillip Keen
PS: For those who didn't see the add, here it is again but without the work phone number:
FOR SALE:
========

Atari 130XE Computer $ 65
30 mb. hd. system with MIO $240
NEC Color Monitor $ 40
Atari XMM801 Printer $ 60
Atari 1050 Disk Drive $ 65

All cables are included. The MIO
has 256K and the SCSI/SASI hard
drive port has been repaired. The
XMM801 printer was freight damaged
All that was damaged was the cover.
The paper knob was damaged by me
turning the paper backwords. Both
of these can both be replaced. The
30 megabyte hard drive system is
two seagate hard drives. A 10 meg.
and a 20 meg. The system boots off
the 20 megabyte one. Due to the
repaired SCSI/SASI port, I would
prefer not to have to split up the
MIO and the hard drive, but will
consider it as a last resort.
The hard drive system includes
a working Carina II v2.5 BBS
system and quite a few other misc.

files. Out-of-town orders the buyer
must pay shipping.

1040. Re: Recursive Action!?!?

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-29 03:39:11 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <55125@cup.portal.com>
Source record: 112137

```
BTW: I tried the [104 104] trick with a routine to compute integer square
root & it works fine. Also, by accident found out you can return directly
to main without passing go:
PROC BS()
[104 104]
PRINTE("HELLO")
;other stuff
return
PROC MAIN()
BS()
RETURN
"OTHER STUFF" never gets executed! The program JSR to the print procedure,
but now the return from the print procedure goes directly to MAIN()!
doesn't really save that many ticks, obscure to the point of nobody knowing
what you're doing, but kind'a cute.
```

1041. Re: VBI's

Newsgroup: comp.sys.atari.8bit

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <55127@cup.portal.com>
Source record: 112139

IMHO: The only reason you'd need to use a VBI is to stabilize the screen display. Like if you are using PM Graphics with more then one player defining an object. You can cheat just a little by watching the timer @ mem loc 20. It is up dated as part of the VBI so if you do something like

```
x=peek(20)
y=x
while y=x do od
;then your stuff that affects display.
```

Unless I miss my guess, procedure names in Action! are the card value of their address so if you really want something to be run every time there's a VBI, you set it to the address of your routine.

Yes, I just dug up the four-part article in Antic about the PBI, and
it is very technical and hard to follow, even though the guy says it's
all simple and straightforward, It looks pretty tough to build an
intelligent device for the Parallel Bus. Lots of bread-board toying
required for this one! The author of the article was on the design
team of the 1450XLD, no wonder it's complicated!

1050. Re: Atari 400 games wanted

Newsgroup: comp.sys.atari.8bit
Date: 1992-02-29 21:19:40 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <H4cXgB1w164w@cyberden.uucp>
Source record: 112152

San Jose Computer, B&C ComputerVisions, BEST, probably, and TeleGames USA sells 400/800/xl/xe stuff...

There's probably many more places, but these are the only ones >I< know of at this time...

Their addresses/ph#s are:

B&C ComputerVisions
2730 Scott Blvd
Santa Clara, California 95050
1-408-986-9960
..they have TONS of stuff, including PD.. you'd better be sure what can run on the 400 (since you only have about 8k) and what is only for computers with more memory/or that are xl/xe

San Jose Computer
1278 Alma Court
San Jose California 95112
1-408-995-5080
..they were the first all Atari store I've ever seen (I never got around to looking until last year, though... before I got my modem). A user group newsletter I get has been saying that they're trying to get rid of all the 8-bit stuff to make room for all ST, so you'd better get it while it's there

BEST.. I have no idea, but I've heard that if they don't have it, Atari probably never made it. They also seem to have a huge collection of parts (chips, etc.) Somebody should know at least their #..

TeleGames USA
222 West First Street
Lancaster Texas 75146
1-214-227-0200
..they have a fairly well sized collection of stuff, but not much of it is for the 8-bits. They seem a little over priced compared to street value, and stores like above (some stuff goes for as little as $5 at San Jose.. even cheaper at a flea-market! (somebody I know got 2 1050 drives for $9!..total!)). They sell for almost every game system ever in exsistance, NES, SNES, 2600, 5200, 7800, XE, Intellivision, ColecoVision, ADAM, GameBoy, Lynx, NEO-GEO, TurboGrafx-16, Sega, Sega Genesis, Sega Game Gear... I think that's it. All I haven't seen in there (that I've never really heard of until weeks ago) is Vectrex (sp?), which is a vector-graphics game machine that came out just as 2600 and Intellivision and all that died..

Well... did that help!? Could somebody post BEST Electronic's phone number and address for us?
Thanks... Bill

If you have an 850 interface, the serial ports are addressed as R1: to R4:.
With a P:R: Connection you have R1 and R2. Bobterm lets you use either the
R1 or the R2 port, so you can connect a modem to one port, and a null-modem
cable to the other.

> thanks.. Bill
>
>BTW: ...howabout an A#: (Atari.. that'd been a neat way of interfacing!)

DOS XE uses A: for its DOS2 disk handler.

> BTW- What is the latest version of ColorView).

The Colrview program uses three files (filename.R, filename.G, and filename.B). Each one is a standard 62 sector file (can be either graphics 9 or graphics 15). The latest version I know of is 2.5, but I heard that Jeff Potter wrote a Colrview "slide show" program and demoed it at the Chicago show.

>2) Is there a Version of CV that will work in Gr. 8? This should allow
> 8 colors w/ 320x200 rez.

I suppose it could be done. Personally I like the Gr. 15 Colrview mode: 64 colors at 160x200. I would like to see a GIF decoder that could do Gr.8 mode with gif files other than 2-color files. A lot of scanned pictures are encoded as 16-color or even 256-color when they're really just black and white.

Bill Marcum bmarcum@world.std.com "Let's get dangerous!"

> May the 4th be with you!
Yup! That's exactly how Digi-View for the Amiga does it. It comes
with 3 filters, red, green , and blue, and the Amiga puts the
files together. The results are quite good.
There is a little more than that to it though. You can't mix
the separate files equally. There are certain numbers you must
multiply the pixel values by in each file.
It's something like 11% blue and 29% red and the rest is green.
This has to do with how your eye works.. or maybe how monitors
work. I can't remember now, I would have to think about it.
If anyone wants to try it, mail me and I can explain how to
combine the files properly.

1054. 3d Glasses

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-01 00:52:53 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <uymXgB6w164w@cyberden.uucp>
Source record: 112153

Has anybody made a 3-d game or something? I just got a cheap (from a magazin) pair of red/blue 3-d glasses. I think it'd be cool to at least make a 1-screen, 2-step animated red/blue picture. Put on the 3d glasses and then close one eye for one frame, and the other for the other frame.

Also, I was watching MTV's Buzz Clip show or something, and they had that new video by Seal (the British guy) called "Killer" and whoever it was hosting said that it looks even better wearing 3d glasses (she had a pait of red/green, I think) or polarized sunglasses. Why is this? I didn't see that much of a difference, except that sorta quick-strobe effect 3d glasses have on certain colors. Yesterday, I was staring at a bright pink sheet of paper (a poster, I beleive), and it would slowly change from purple to blue and back.. really cool. So, what 3d glasses software has been made? (I mean.. these computers have been around for about 15 years! SOMEthing must've been done!)
Thanks.. Bill Kendrick

1055. FAQ: comp.sys.atari.8bit

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-01 04:28:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GH3VN3ERNK8ZDYC5@carleton.edu>
Source record: 112150

Frequently-Asked Questions

comp.sys.atari.8bit

Revised 27-Feb-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is this Usenet newsgroup, dedicated to the free
exchange of information pertaining to the 8-bit Atari computers:
the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit,
collected and e-mailed to subscribers on the Internet who do not have access to
Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not
implemented at this time. Thus, one should NOT post to
Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear
on comp.sys.atari.8bit.

What is the atari.archive?
atari.archive.umich.edu is the anonymous FTP site which contains many
files for the 8-bit Atari computers. Those with full Internet access can FTP
to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in
your e-mail address as your password. (If you don't have FTP access, see
below, "What is BART?") Now type "cd atari/8bit" to reach the
8-bit directories; there are four subdirectories within the 8-bit directory:
cc65, new, sio2pc, and zmag.
The file 8-bit.cat contains short descriptions of all the files available,
and the file 8-bit.text contains somewhat longer descriptions.
Users may upload new files to the atari/8bit/new directory. If it's not
obvious, please also upload a .text file describing your upload; alternatively,
send John Dunning a note naming and describing your new upload: his address is
jrd@stony-brook.scrc.symbolics.com.
When downloading or uploading to/from atari.archive, be sure to have
file-type set to BINARY when transferring binary files (.arc, .com,).

What is BART?
Some persons have Internet e-mail access but do not have FTP access.

They, too, can access the atari.archive library through the BART mailer. BART's address is atari@atari.archive.umich.edu. BART automatically UUEncodes binary files before e-mailing them to you. If you are a first-time BART user, send it message that says this:

help
send 8bit/-read-.-me-
send 8bit/Index

Even if you do not have FTP access, you can still upload new files to the atari.archive. Send new uploads (UUEncoded, if binary) to John Dunning at jrd@stony-brook.scrc.symbolics.com.
While in the past UUEncoded binaries have been posted directly on comp.sys.atari.8bit, the practice is discouraged because Info-Atari8 Digest subscribers find it frustrating to have to scroll through long UUEncoded messages to find the postings they can actually read. Please e-mail UUEncoded binaries to John Dunning instead; he'll upload them to the atari.archive where everyone can get at them.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the original Atari online magazine, with over 200 issues published so far. It covers the 8-bit Atari computers exclusively.
Z*Mag is NOT the same thing as Z*Net, though they are published by some of the same people.
Most issues of Z*Magazine since #157 are available in the /atari/8bit/zmag directory at the atari.archive.
Greg Lindahl, gl8f@fermi.clas.virginia.edu, has created a mail-list for distributing Z*Magazine to subscribers over the Internet. However, his mail-list is not in operation at this time because no one has offered to supply him with the new issues as they are released. Contact Greg if you can help.
To contribute to Z*Magazine, send your articles to Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board system. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can telnet (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG members-list are automatically members of the official Atari users' group CAIN - Central Atari Information Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

Are there any magazines still supporting the 8-bit Atari?
There are several:

Atari Explorer Atari Interface
Subscriptions Unicorn Publications

P.O. Box 6488 3487 Braeburn Circle

&21.00/6 issues air

Are there any product developers or vendors still supporting the 8-bit Atari?
Ben Poehland has created quite a long list of firms devoted to the 8-bit Atari market. This file is called vendlist.arc in the /atari/8bit directory of the atari.archive.
Ray Wilmott maintains a similar list. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
Yes! There are three files at atari.archive that claim to do this. They are: atario21.arc, pcxfer.arc, and util.arc. Each of these programs runs on an MS-DOS type of computer. For disks written on your PC to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the

Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0S/2.5 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is not being manufactured at this time. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

>an object.

Not at all. You also need to use a VBI to properly scroll the screen,
to handle joystick/keyboard input the most efficiently, to keep track of
real time accurately, to control sound generation, and a LOT of other
things.

Mike Farren - no longer employed by Commodore. Still only my opinions,
and not those of any organization.

>and then close one eye for one frame, and the other for the other frame.

It's been done, but it doesn't look too hot. There's too much bleed through
because the colors aren't that pure on the TV set (or most composite monitors).
I saw a game on an ST once that used this kind of anaglyphic 3D graphics
with vector figures, and it looked pretty good.

I used to have an ST myself, and had a pair of Stereotek LC shutter glasses.
Those worked quite well, in my opinion. I still have them, and when I get
some time, I'll mess around with them on my PC. Seems these would be
easy to connect to the 8 bits, though. On the PC, the page flipping
in VGA is a pain, because there's really only one decent high-resolution
mode you can use and still get page flipping, something like 320x400.
With the 8 bits, the color and resolution aren't as good, but everything's
simpler. You could do everything quite easily with a VBI routine. And page
flipping is easy too. I guess for P/M graphics, you'd have to keep track
of two complete PMBASE's, and swap between them during the VB.

Has anyone done anything like this with the Stereotek glasses?

Mark

1059. IBM version of 8-bit emulator

>Please post on how to do it if you did.

I had no problems with the file- everything extracted ok. But as
mentioned earlier, it was pretty stupid; there was a complete copy of the
800k .zip of games WITHIN the 1.6 Mb .zip, so it was twice as large as
it needed to be!

I grabbed a copy out of curiosity and tried some of the executables
on my 800 using SIO2PC. All of the ones I tried worked fine, but I only
tried about a third of the 90 or so games.

Mark

ps. What other games were in that Lucasfilm series, like Koronis Rift?
I have a vague memory of K.R., with an alien tapping on the side of
the spacecraft.

1064. SDX

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-02 03:48:55 UTC
From: a644690c@edinboro.edu
Message-ID: <00956F431062F360.20605204@edinboro.edu>
Source record: 112159

Greetinx,
I was doing some reading in the SpartaDOS X manual today, and trying
to figure out the difference between the difference between a SDX extarnal
command and a held in memory application. With the LOAD command, you can
take an external command and make it 'held in memory'. When checking
memory with MEM, the second Main value increases acordingly and calls to
the command occur a bit faster. HOW does DOS know that the _file_
now resides in memory??? Also, .COM files on CAR: seem to all start with
FE FF 01 xx and most of the .SYS files start with FA FF xx xx instead of
the normal FF FF xx xx for binary files. Does anybody know what the
distinction between the headers are?

More Questions:
1) How does an _installed driver_ relate to _held in memory apps._?
2) What is the true meaning the the ext: values reported from
the MEM command? I know that ext: is banked RAM, but how
do you get an application to reside there?
3) What conditions have to be met in order to make an application
held in memory?
4) Is is possible to patch a program into banked RAM with the
rest of SpartaDOS?

The SDX manual mentions a LOT of pretty cool things that can be done, but
never really goes into detail as to how. I would like to write a
little program to allow me to scroll through a couple previous
CLI entries and I found the locations necessary to do this (I think).
I may be able to patch CKEY.COM (a great little program) but I really
would like to know more about the strange memory management in SDX.

If someone could explain briefly the diffrences and functions of
the above file types, I probably could figure out the rest. I would,
however, like to hear from anyone who has done any SDX programming.

(BTW- I am using and 800XL with RAMbo 256k & SDX w/ an R-TIME 8).

Peace, | May the next revision of
| COBOL simply be abbreviated

Hmm.. Sparta POKES to screen? That stinks. What about some sort of chip replacement to overcome this? I suppose that'd need some sort of driver as well, though. The E: stealer is a pretty interesting concept. I like having "x:" and "x#:" device specification, rather than "A:" and "B:" and that on IBMs. Atari's are really good in their own special way! ;) c-ya

1066. 3d glass demo.

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-02 06:24:32 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <LZwZgB3w164w@cyberden.uucp>
Source record: 112165

For those of you with a pair of 3d glasses, try this demo:

```
10 GR.23:POKE 712,0:POKE 708,64:POKE 709,130:DIM C(21),S(21)
15 FOR I=0 TO 21:C(I)=COS(I*.3):S(I)=SIN(I*.3):NEXT I
20 R=0:F=1
22 TRAP 30:T=NOT T:COLOR T+1
25 FOR B=1 TO F:R=R+1:PLOT 79+R,47:F.I=0 TO 21:DR.R*C(I)+79,-R*S(I)+47
26 T=NOT T:COLOR T+1
27 NEXT I:NEXT B:F=F+1:GOTO 22
30 POKE 708,64:POKE 709,130:GOS.100
35 POKE 709,64:POKE 708,130:GOS.100:GOTO 30
100 FOR B=1 TO 228-PADDLE(1):NEXT B:RET.
```

This'll draw a dart-board like circle (sorta like a bent checker-board) made of the best blue/red combo I could come up with for red/blue 3d glasses. If you have a red/green, try adjusting the 130 to something around 194, perhaps (maybe post the best green).
To adjust the speed, use paddle 2. If you don't have paddles (how dare you!), just make the "228-PADDLE(1)" some number. Now put on the glasses and just stare! Really hypnotic! If I used drugs, it might be even BETTER!... but I'm not going to start for just a demo.!! ;)

Maybe one of you has had experience with bio-feedback. Now THAT'd be the best! I more mellow you get, the slower the colors cycle!

The next post will have a somewhat shorter program that does a different demo, but still for 3d glasses.
Just for fun, here's a quick run-down of this one:
line 10-set/screen and color and an array to capture some trig stuff (for speed)
line 15-capture the trig stuff
line 20-set a couple-a variables (radius and F (why?, who knows! probably has some strang meaning in the universe!).. F gets bigger to make the dartboard effect, rather than just bars of light coming from the center.
line 22-trap and do the dartboard color set-up (one more color toggle)
line 25-uses B to go F times..makes the Radius bigger, draws a circle
line 26-toggles color
line 27-closes FOR loops and loops circle
lines 30-35-changes colors and gosubs the pause loop
line 100-pauses depending on paddle turn
later! Enjoy this demo! (probably still looks good without the 3d glasses, so try it if you're really bored!)

1067. Another 3d glasses demo! (yipee!)

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-02 06:34:04 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <HFXZgB4w164w@cyberden.uucp>
Source record: 112164

here's a "screen-burst" demo using the 3d glass colors and "bio-feedback"
pause routine: (you'll recognize the screen or screen draw routine used)

```
10 GR.23:TRAP 30
15 FOR A=0 TO 159 STEP 10:T=NOT T:COLOR T+1:F.B=0 TO 9:Z=A+B:PLOT Z,0
17 DR.159-Z,79:PL.0,Z/2:DR.159,79-Z/2
20 N.B:N.A
30 POKE 708,64:POKE 709,130:GOS.100
35 POKE 709,64:POKE 708,130:GOS.100:GOTO 30
100 B=228
101 B=B-1:IF PADDLE(1)>B THEN RETURN
102 GOTO 101
```

Note that this one uses a slightly different pause routine (which I
forgot to replace in the last demo, so you can just replace line 100 with
this ones 100-102) that responses much more quickly to paddle
adjustments. Here's another rundown:
line 10-graphics mode and trap (one line goes off the screen at the very
end of the draw routine)
lines 15-17-draw the starburst, using alternating (red/blue) colors
(again, adjust blue to green if you have the red/green 3d glasses rather
than the red/blue. I'm not sure why there's a difference, but I'm pretty
sure there is...)
line 20-loop!
lines 30-35-again, switch the colors registers and pause
lines 100-102-set pause variable to maximum length (228-paddle's highest
valuse), subtract 1, if the paddle has been turned beyond it, get outta
there (a for/next wouldn't do this)..otherwise check again (goto 101)

That's it! Again, enjoy these two demos. The circle one is a lot
better, but I decided to post this one because I'm one person, and it
seems that certain 3d glass effects look differently to different people.

Hmm.. I just saw the Fuji on my disk box.. maybe I'll load up Fuji spin
and try it out on my glasses! Wee! What fun! Maybe I'll see what
effect clear/blue glasses have on 3d stuff (get those in Rice Crispy's..
I got my red/blue in the Simpson's annual 3d issue (why we get the
Simpson's magazine, God only knows!))
Wellllllll.... adios... happy self-hypnotizing!!

```

Anyone interested in purchasing a 800XL or 1 or 2 1050 Drives for
the 8-bit system write me and make me an offer. I am no longer using
the units and will take any reasonable offer. All work fine except
one of the drive units requires a small piece of paper under the lever to
insure the head goes down far enough to read the disk. It works great and
I have no problems with it. Make offers to :

> Thanks.. Bill Kendrick
>

The ACORN user-group from Rochester NY had a program in there library
(that I belive was written by a member) that would display SOLID STATES
images in 3D w/ Red/Blue glasses. I can dig up there BBS no. if anyone
is interested.

I have been trying to acquire a pair of Sega 3D (or similar) glasses for
a while now. I think it would be easy to simply drive them during the
VBI which would sync. perfectly with the page flipping.

To the person asking about the PC interface: I have some simple schematics
lying around for connectiong the Sega glasses to an rs232 port and some
'C' source code to drive the VGA for page flipping. I will try to find
it if you are interested.

Peace,
-Adam Conover
a644690c@edinboro.edu

Source record: 112169

Not to be too picky, but by stabilize the sceen I meant it to be inclusive not exclusive of any other use. The joysticks are allready read during the VBI, & muzak doesn't have to use the VBI, it can just as easily use a simple timing loop, a DLI, or one of the other hardware timers.

|> or each line. I saw mention of it before, but was still unsure about it.
|> BTW- What is the latest version of ColorView).

They are three separate files, each being a 7680 byte GR.9 file. Use the extenders .R, .G, and .B, and ColrView will load them directly. I have a small sample of ComputerEyes pictures that someone created by just the technique that you and Bill Kendrick are talking about. Some look great, some don't. I can give you specific filter information if you are interested. You might get into trouble with the type of lighting to use (if you try to digitize another photograph), and with the camera's color response (I don't know if the ComputerEyes camera is true panchromatic, or equal response to all colors).

The latest version of ColrView is 2.6 (limited distribution), but 2.5 should be out there.

|> 2) Is there a Version of CV that will work in Gr. 8? This should allow
|> 8 colors w/ 320x200 rez.

Graphics 8 is not supported, but graphics 15 is in V2.5 and 2.6. Hmmmm.... GR.8 would mean eight colors, but they would only be primaries...although you could select the three color components at will....I'll think about it.

Source record: 112172

A brief note concerning the clear/tinted 3D glasses:
(aka Yo Yogi)
These glasses work only because the subject is in motion. Basically, if you have a static background and the subject is moving from left to right, and you put the tinted lens of the glasses on the right, the subject will pop out of the screen. (You all might like to try this on the opening segment of Star Trek: TNG where the Enterprise SLOWLY moves across the screen from left to right. GREAT 3D effect!

The gist of this is, all you need to do is find a game where the subject only moves in one direction relative to the background (left or right) and you can have a 3D game. Zaxxon is an obvious example that comes to mind. The ship is static and the background moves from right to left. So... with the tinted filter on the right, the ship should be at the level` of the screen with the moving background appearing behind the screen.

Any unidirectional horizontal scrolling game should give the same effect.

Sega glasses:
I have not used glasses like this for video games, but I have used them with a 3D Camcorder and the effect is quite good.

I also talked to Derek a couple of times about his MS-DOS emulator for
the 8-bit Atari. He told me that he had tried to get Atari's approval
to release it but their either refused or wouldn't give him a definite
yes or no. I don't remember which. Anyway, he said that he wouldn't
release even a beta version without approval. I don't know why Atari
would care since they have dropped ALL support for the 8bit. :-(

On a related note, does anyone know what the status of the 8bit hardware
emulator that DataQue had proposed? I don't remember their code for it
but it is (or will be) a plug in card for the MS-DOS machines that allow
the running of Atari 8bit software. It was to be essentially an Atari
8bit computer on a pc card. I mailed a message to them indicating that
I was definitely interested, but have heard no more. I didn't send a
deposit as was suggested.

I know BRAsoft is developing an ST emulator for IBMs, called (currently)
GEMulator, but I don't know of any plans for a IBM 8-bit emulator...

> Is it a FULL spreed version?

Darek explicitly stated (at Chicago) that his 8-bit emulator for MS-DOS would NOT be distributed due to legal difficulties with Atari and the XL/XE operating system. It did run at close to full speed if not at full speed on his 386sx laptop he had at the show.

1087. MAIL CAMPAIGN (Revised Notice)

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-03 15:26:20 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9203031526.AA27478@smithkline.com>
Source record: 112179

Heads Up, Atari 8-Bitters!!

This Is for YOU!

Beginning 1992, the Atari 8-bit computer- and the community
of dedicated users who still cherish these machines that spawned
a revolution in home computing- has been officially discarded by
Atari Corporation.

BUT WE REFUSE TO ROLL OVER AND DIE AT ATARI'S COMMAND!!

We believe there are enough of us left to pursue our 8-bit
interests independently of Atari Corporation.

Would you like to see a single common forum in which users,
developers, and vendors can communicate? A print medium wherein
advertisers can reach their intended customers with assurance, and
where users can look with confidence for information about their
favorite products and answers to their burning questions? A user
oriented publication to fill the void left by the collapse of
ANTIC and ANALOG?

My name is Jeff McWilliams, and I'm a dedicated 8-bit user.
I want to present the Atari 8-bit community the chance to gather
under one publication, one that's exclusively for the Atari 8-bit
computers. A magazine that will unite our community and give it the
strength it needs to survive. A forum where users can ask tough
questions and find unvarnished product reviews. A magazine that
will contain advertisements exclusively from 8-bit vendors.

I propose a write-in campaign to Atari Interface Magazine,
asking for a separate exclusively 8-bit magazine called "Atari
Classics". Atari Interface Magazine already has a strong
presence in the Atari community. For several years A.I.M. has
been a combined ST/8-bit magazine whose publishers have indicated
their willingness to support the Atari 8-bit community as long as
interest warrants it. NOW is the time to ask them for our own
magazine!

As Campaign Manager, I will act as the focus for this effort.
Now, you might be wondering, "WHAT CAN I DO TO HELP?". That part
is EASY!

Just SEND me your NAME and POSTAL MAILING ADDRESS. I will
mail you a FREE Information Kit describing our goals in greater
detail. Included with the Kit is a stamped postcard on which you
can express your interests and willingness to subscribe to an

exclusively 8-bit publication. (Or, if you disagree with our approach, you can just toss it away and that will be the end of it- BUT WE DON'T THINK YOU WILL!) You'll also be able to indicate your willingness to participate in the magazine DIRECTLY by being a regular columnist, editor, or just writing about a special project you've done or a review of a product you've used.

Ben Poehland, the former 8-bit Editor of Current Notes Magazine, is fully supporting this campaign and has offered to donate his services to "Atari Classics" when repairs to his fire-damaged home are completed later this year.

The cutoff date for receiving the postcard responses is:

APRIL 15, 1992.

If by that time I have received 500 positive commitments by postcard, they will all be sent to A.I.M. along with a petition requesting the formation of our proposed exclusive 8-bit publication "Atari Classics". If I receive less than 500 replies, then we will know that the 8-bit community has indeed become a lost and hopeless society. TIME IS RUNNING OUT. THIS MAY BE THE LAST OPPORTUNITY YOU WILL HAVE TO KEEP YOUR MACHINE ALIVE AND SHARE YOUR EXPERIENCES WITH YOUR FELLOW USERS.

IMPORTANT!! Only the OFFICIAL Campaign postcards will be accepted! Those responding by other means will be mailed an Information Kit with which they can register their official response.

PLEASE DO NOT SEND MONEY! If anyone wishes to assist the Campaign, they can do so by posting this release in its unmodified entirety to other on-line services, Bulletin Board Systems, usergroups, friends, and vendors. Additional assistance can be rendered by gathering names and addresses of Atari 8-bit owners and furnishing them to me so I can mail them an Information Kit.

If you're REALLY SERIOUS about keeping your Atari 8-bit classic computer alive, be sure to obtain the Information Kit and return the included postcard appropriately filled in. Every day more 8-bits get stashed in attics or closets, or simply thrown away. Atari's Classic 8-bit computers- the 800/XL/XE machines- are every bit as useful and productive today as they were in the heyday of 8-bit technology. They deserve a better fate than the local landfill!

I am a BIG fan of the Atari arcade game KLAX, and I heard from
this newsgroup that someone was working on a game called KLIX.
Is KLIX supposed to be anything like KLAX?

>programmers primer?)
>
>Later.......

I don't know a thing about this chip, what is it? A graphics chip?
What kind of display, how do you talk to it? Etc. Or, could go to
a TI 34010 or something like that. Heh heh. I don't see the problem
with the 7800 chip, the analog signals are probably the video, which
would be separate ports on the card, like the XEP80. OBVIOUSLY
you can't expect the 7800 video coming out of the Atari Video port
just "like that". A great book to get into Machine Language , if
it is to be had, is the _Atari_Roots_. It is my first 6502 book,
and it is extremely easy to follow. Compute's two books they did on
programming the 6502 were also fair as I recall. Don't know of many
others folks. Most of my other reference manuals that I have for
assembly, which I rarely program in, are De Re Atari, and the
"Programming the 65816, Including the 6502, 65C02, and 65802"
by David Eyes and Ron Lichty. Oh, and I am also FINALLY ordering
the Technical Ref. Notes and 1200XL addendum, a must have in my opinion.

Gee, funny how it takes a processor with "the Trememdous horsepower"
like the 386SX chip to even come close to running at full speed an
emulation of the Atari 8 bit. What does that tell you, folks?

Cross-posted to: comp.sys.atari.8bit,rec.games.video,su.general

hello, I'm posting this for a friend who is trying to rebuild
his atari 5200 controllers.

what he wants/needs is:
a) a source for new controllers or,
b) a source for the flexible circuit board that appears to be
the heart of said controller. or,
c) a kludge that allows some sort of proportional joystick to be
used in the standard controllers place (y'know like a joystick
from an apple II+). or,
d) schematics for the standard controller so that I will build said
kludge for him...

Please email responses since I am posting this to some groups that I
normally do not read... thank you.

Source record: 112185

FOR SALE:

ATARI 400

Yes, I am finally selling this Mecca of computer power. For those of
you that have been waiting for this moment:

1 Atari 400 with 64k RAM, and a nicer keyboard.
1 A disk drive (I don't remember which one)
1 tape drive
1 dot matrix printer with lots of paper
Tons of games and some other software.

All this can be yours for the low, low price of $300(negotiable).

Take advantage of this great offer now. Remember you can't buy it in
stores (not anymore...)

Contact Mark Jansen (617)437-7795 or mjansen@athena.mit.edu

1094. Reading an Infrared remote by an Atari?

Newsgroup: comp.sys.atari.8bit

In March, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
New User Help. We will also discuss the upcoming ACE '92 in Toronto
on Apr 4th and 5th and sell advance tickets.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the March issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, Mar 11, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for more information.

Hope to see you there,
Dani Roloson

Yes, I was really looking forward to this little puppy, but Chuck at DataQue appears uninterested in his old projects lately. There has been no word on any of the wonderful things he mentioned he was going to work on. When I asked him about it on GEnie, he simply said he didn't think it was going to be released and gave no explanations. Maybe if we all bugged him about itt, he'd at least tell us what happened to the project. He had mentioned having working boards made up at one point, maybe he'd be willing to sell the plans... (I doubt it...)

I was also really looking forward to his 'C' compiler on a cartridge, but this too has been postponed indefinitely.

How about some sort of hardware device.. Is there any out there that can steal only R G or B out of an image? As for keeping the picture aligned, if it were a photo or poster or something, and you used a tripod, it should be relatively lined up. Especially because of the 16 shade modes low horizontal res. As for the vertical res, I don't think that'll matter, because the colors'll be blending only slightly. It SHOULD work.. can't wait to try. I might be able to get my brother to borrow some R G & B filters, as he is a video producer... l8r! Bill

It uses 3 files? Really? Well then THAT'S SIMPLE! I could start making some demo pictures! All I need is the software!! What would I write to the archive to have it send? send 8bit/colrview.arc ?? right? Has anyone tried to make a paint program that uses RBG? I'm also wondering how the actual memory is managed. It isn't just 3 screen (1r, 1g, 1b), but the lines are alternated, each screen (if it were alone) looking much like an APAC non-interlaced 80 x 96 x 256 screen, but in 80 x 64? x 4096. Then the DLI's are flipped (rolled, actually), and the next page is shown. I also wonder how much system time this takes to keep the screen from flipping out? If it uses 3 blocks of memory (1 for each .R .G and .G file screen), then the DLI not only has to switch colors, but also jump to the other screen. Doesn't this take a ton of time?

If it DID use 3 blocks of screen memory, 1 for each color, if you wanted to draw a colored line, all you'd do is POKE 88 & 89 to the screen, then draw with that screen color's appropriate luminence (0, say, if none of that color was included), then POKE 88 & 89 to the next screen, etc. I suppose for a white line, you'd do something like:

```
POKE 88 & 89 to "RED" screen
COLOR 15
PLOT x1,y1
DRAWTO x2,y2
```

and do it three times, the next two going to "BLUE" and "GREEN" screens. Sure, it'd be slow, but this'll be the MOST colors on ANY 8-bit at once, and not using some other system's files! Wow! I'm impressed!

And, finally....!! What formats does the latest version of ColrView load? GIF (probably, right?) ILMB (again, pretty probable).. what else is there that handles so many colors?? Or does it need a converter, or does some other system actually use "*.R", "*.G", and "*.B" files??? HELP ME OUT! I'VE NEVER SEEN THIS!!! Thanks... I hope I get at least >1< question answered!! :)

```

IS THERE ONE?! I know of the 130xec, which is a card (in development las
I recall). With 130xec, you can have 4 8-bit cards running at once on a
VGA monitor, since it has a res of 640x400, and the 8-bit has 320x192.
IT sounds pretty cool, but seems so early in development that it
shouldn't be out any time soon. Am I wrong? What else is up on this??
thnx

1104. Genesis controllers

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-04 00:14:06 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <8653gB8w164w@cyberden.uucp>
Source record: 112057

Who out there has a spare Genesis or Sega Master System controller (if they work the same.) I hooked up (quite scared at the time!) a pair of Genesis controller and to my amazement, the pad works exactly as standard 2600 9-pin joysticks, and the B button worked as FIRE. Also, C would turn paddle(0 (I believe)) from 0 to 228, or vice versa (I think it WAS FROM 0 TO 228, not the other way). I couldn't get the A or START buttons to work, but I think all THEY need is some sort of re-wiring or something... Now, not to get TOO Nintendoish, I'd LOVE to have a pair, and really want to start work on games that use it. There are already some games out there (Xevious and Zybex to name 2) that COULD use one, but don't. With Zybex, you'd probably have it down all the time, anyways, but on Xevious (the 5200 port, not the lame one with the airplane and "over and over again" landscape and no flying enemies), since the fire is auto, and it's so slow, a manual'd be nice. Anyone up to it? (shouldn't be TOO dificult, could it?)

Has anyone worked on multi-fire controllers for the 8-bits? Or software that uses them? I suppose it'd only be polite to add the feature of 1-fire button use (such as auto-fire for the 'C' button, or a keyboard control or something.)
Remember Spy Hunter? I remember my brother had that for his c64 and always borrowed my joystick for the other fire. Why didn't Atari think of this type of controller?? Also, why do so many computers USE these controllers!? Amiga should've went for something better than 9-pin... (oh, wait! hah...no, they used to MAKE 9-pins! NO WONDER! ... opps!)
Well.. enough babble... Anyone have a spare? (I'd hate to waste $20 on a joystick!) Thanks... Bill

Ever notice that AtariWriter+ and BobTerm don't fully close? Just now, I printed something, and when it was done, I hit OnLine on my printer (xmm801, if it matters (ie that's the problem)) and it printed another line. (this was using BobTerm.. I saved capture to P:)

Also, with AW+, when I go to directory ([1] or [2] on the main menu) or some other disk activity (load, etc.. or spellcheck), after I've printed something, it will print one more line (usually just the last of the bottom margin, but I suppose it could even be something ON the bottom margin, if I happened to have formated the page that way.. and wrote EXACTLY that much...)

Well? Has anyone else noticed this? Just in case, here's what I got:

xmm801
1200xl (no upgrades)
BobTerm 1.21
AtariWriter +

.. I feel that any of these could be the problem, but as I said, it is probably BT, and AW+ seems to do it alot... Well? Thanks...

1106. 3-D glasses for a blind man

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-04 02:34:54 UTC
From: cpbuehrer@miavx1.acs.muohio.edu
Message-ID: <1992Mar3.213454.9905@miavx1.acs.muohio.edu>
Source record: 112192

All this 3-D stuff is real nifty, but I got a question...

I'm virtually blind my right eye...I can see things okay...images aren't blurry or anything...but I can't focus on objects...it's almost like having just peripheral vision in that eye. I can see colors, shapes, etc...but I can't for example read a billboard...or even a book.

Those 3-D glasses you get from Arby's to watch cheap horror movies on the local tv station...those don't work for me.

Does anyone know if these stereotek glasses would? I'm assuming only people with similar problems will attempt to answer this.....

Wrong! Not everyone can get the archive. In the UK we have a nightmare of a time getting to the archive. Just 1 relay capable of doing this, and only at strange times of the day. Then the link is often a bit dodgy, and files get corrupted. The net is easier for some people, but perhaps not for others. I thought I was doing people a favour by posting my PD free to the net, but quite obviously I wasn't. You can always buy it from me at 2pounds a disk like other people have to. Then you'd be moaning!

I really doubt it since you need to be able to use two eyes for the
brain to figure out distance from an object. A good way to find out for
you is to try one of those View Master viewers. This is the best example
of 3-D in a 2-D format that I've seen. (It's really quite eeary)

My sister just had eye problems where she couldn't see out of one.
(Well, she could just tell different levels of light) Anyway, if
somebody would hand her something, sometimes she would miss the object
completely, because with only one eye, you really can't tell where
something is.

Message-ID: <92064.105518AKH104@psuvm.psu.edu>
Source record: 112199

Ok, I just got a 1meg mio. Why is it that 192K sparta disks fit 192KRamdisk
but 92k atari disks require 192k as well? Is this because the sectors are
always double density? and I am waisting half of the 92k? Also...why
is it that atari dos 2.x cant format the mio when I boot up from a floppy
but if a sector copy it to the ramdrive and boot off it dos can recognize it?

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <55362@cup.portal.com>
Source record: 112060

Small world! I was doing a rather esoteric hack; using a 1020 as a digitizer. I used an end of tape sensor that contained an IR emitter/detector & while I was fooling around I pointed a tv remote control & got a good response. The program I was using just read the pots & gave some audio feed back to let me know the levels for setting the IR LED current. I think Radio Shack has a detector/amp, but I REALLY dislike those Bozos. ANY IR photo transistor by itself should be able to get wired across the +5V & pot line.

1111. UPDATE: MAIL SURVEY CAMPAIGN

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-04 17:05:59 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9203041705.AA03481@smithkline.com>
Source record: 112200

********** ATARI CLASSICS **********
********** MAIL SURVEY CAMPAIGN UPDATE **********

Hard on the heels of his exams Jeff McWilliams just completed a massive mailing effort & brought the Campaign Database up to date. He just took off for a few days' well-deserved R&R. Before leaving he sent me some figures & asked me to post this Campaign Update to the Digest.

About 450 Campaign Information Kits have been mailed out to individuals so far. (All but about 30 of these are domestic USA addresses.) Returned postcards number 170.

Quite a few kits are presently in transit. These are mostly bulk shipments to various usergroups. I don't have precise figures on the quantities involved, but I reckon it's 200-300. 50 kits are in transit to Mike Jewison, our Canadian representative, & an additional 125 are on the way to Jeff to replenish his depleted stocks.

In addition, within the past week I've sent out over 150 kits to various international addresses plus a large domestic bulk request.

A trickle of international responses is coming in, mostly from Canada & the British Isles.

The Campaign Staff officially welcomed Colin Hunt last week to represent Campaign interests in the U.K. We got any Australians on this Net? The Campaign is seeking a representative for Australia. Gives us a "G'day!" if you're out there!

A total of about 1000 info-kits have been printed, with roughly 900 already distributed or in transit. We are about as on-schedule as a project like this can be. Production of kits is ahead of schedule, distribution & returns are a little behind. By the end of the Campaign kit production might run as high as 2000, well above original plans.

We'd like to remind everyone the Campaign is now global, & the termination date has been extended to April 15. Still plenty of time for everyone to participate!

If you're just now finding out about this effort, send your POSTAL mailing address to:
Jeff McWilliams
INTERNET: jjmcwill@mtus5.mtu.edu
GEnie: J.MCWILLIAM3
CIS: 70714, 523

to receive an Information Kit in the mail.

Source record: 112061

Well, I was hoping someone else would respond: Nothing personal, I'm just getting WAY behind in stuff I've promised. If you can, get a Microport. If you can't find one let me know & I'll see if I can get some docs to you. It was made by the Supra people so they may still have one laying around. It was a cute little bread board that connected to the bus. It had a PIA and decoding to addess it in the $D300 to $D700 range. I only used my to make a LED real time clock (Big deal!), but it has docs for making an EPROM burner etc. Supra had hoped that 1,000's of Atari users would take advantage of their bus device to make after market products, but dead beats that we it never happened. We have met the enemy & he is us, to coin a phrase<grin>.

>
>Dean Garraghty. djg0@uk.ac.aber
>

Dean, have you tried accessing the archive with the BART mailer? All you need is email to use BART. You just mail it a command, and it mails you a file. This is how we can say that everone can get at files on the archive. If I had excerpted a little more from the FAQ, perhaps it would be clearer.

On the other hand, if somehow you can't use BART I want to know about it, because as far as I know anybody with Internet e-mail can use it.

If you haven't caught the FAQ on here yet, let me know and I'll send you a copy.

In a msg of <27 Feb 92>, Tim Gearin writes to All:

TG> particular) What exactly is a
TG> 'vertual' address? I have some idea
TG> of what it is but not anuf really.

I think you mean a 'virtual' address. Basically it is an address that in reality is not what it is according to the system (OS). As opposed to a 'real' address (an explicit location in a memory chip). In some cases an OS might allocate a block of memory say $1000 to $8000. Then a sub-level system might use these areas, but in that realm they would be addressed as $0000 to $7000. The sub-level system would indicate $1005 (for example), but in reality, that address refers to $2005 location on a memory chip.

Large scale mainframes use this terminology. Both swapping and virtual machines are additional terms relevant to the 'virtual' memory idea.

To simplify, you don't really care what 'real' address is being used as pertains to your program. Unless you are having electronic difficulties with your memory chip(s), then it would be necessary to isolate the real address.

Many layers of the virtual concept can exist complicating the matter further.

Post me, I'm wondering if my mail is getting thru.

TG> the time? I know why actualy but

I think AWESOME is on the Archive, but I have a copy I could uu-send you, if you could send me YAU (someone else did, but I ***ked it up..) Also, could you (while you're at it!) send me Das_Omen. My copy NEVER works no matter WHAT I do to any version of it (uu/dcm/disk)!!!

AWESOME isn't that good.. except the 256color apac kalidescope with the cool song (forget what it's called.. one of my friends said that the guy was at a wine festival in my town one time and played the same song!).. The music is so/so, and the graphics are really good on some bits, and pretty lame (the band.. Major Tom, I beleive????... only good this is the # of colors... must use some phunky dli, because the vertical positions of the players are overlapping...) on other bits.. Have you seen "KAL"? It's a compiled action! demo, I beleive... and it's a hexagonal, vertically overscanned, VERY FAST updating kalidescope... Awesome has one just like it to a Pee-Wee's Big-Adventure-ish song... you'll be fairly impressed. Not as good as expo91 in most aspects (tech.wise), but much better in the demo-ish-ness, not the "greetinx" text-scroller type show off thing..

BTW: I "stole" (borrowed) "P.10" file from expo91 into my new game (klax demo).. this is the music to the 1st demo ("POKEY") and 1 in the middle ("COMTECH CREW")... really cool music.. I'd like to see if I can extract the 2nd song for an adventure game... also, does "beat-it" demo (the other "POKEY" one) flicker like crazy on your system? Do you know if it's just NTSC, or my 1200xl? Thanks! adios! Bill

It tells you only that to implement custom graphics chips entirely
in software is no easy task. Figure out a way to interface the Atari
800 chipset to the IBM bus, and you'd have one hell of a screaming
system, eh? Without that, it'd take something like a 386 to get
the necessary stuff done in time...

1123. BART mailer etc.

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-05 10:16:40 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar5.101640.23423@aber.ac.uk>
Source record: 112069

Yes, I do have a copy of the FAQ, and do know about the BART mailer. I tried using BART and it just didn't work properly. Also, we are restricted here at Aberystwyth when sending mail. Mail to the States costs the university a lot of money, which it can ill afford. If you send too many emails to foreign countries you get a bill for the amount, which comes as a shock! We've only been allowed to post to the net since last September. Before that, we could read but not post. British Universities have to work on very tight budgets, especially here because we are so small. Posting onto the net is the only way I can ensure things get to people, without too much cost. It's also a lot easier for me.

From: SOEF_16@leicester.ac.uk
Message-ID: <9203060052.AA10594@ucbvax.Berkeley.EDU>
Source record: 112079

I have just downloaded MYDOS 4.50 from the archive. Seems a good
DOS, although I personally prefer a command line interpreter to
a menu system. You can run TURBO BASIC XL from it unlike
SPARTADOS or OS/A+. It supports true double density but it doesn't
seem to offer a US DOUBLER-like fast sector format :(

Is there is any way of using the fast format on MYDOS?

BTW is the Dutch BIGDEMO disk available in the USA? It has the
standard scrolling text and some excellent music/samples. I will upload
the file to the archive in the next few days.

1125. ACE '92 Update: Prizes and Banquet

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-05 16:20:28 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1992Mar5.162028.5518@watmath.waterloo.edu>
Source record: 112070
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

The Atari Event of the Year:

On April 4th and 5th Atari (Canada) and the Toronto Atari Federation will host ACE, the ATARI Canadian EXPOSITION. This is likely the largest Atari event in North America for 1992.

To be held at the Skyline Hotel, the 1992 ACE show will feature the leading developers with the latest in leading edge software and program updates. Local Ontario dealers will exhibit the newest hardware and peripherals. User Groups from across Canada and the USA will be on hand to share Public Domain and Shareware applications.

April 4 - Saturday 10-6
April 5 - Sunday 11-6

Admission $6, $5 in advance from Atari clubs.
If clubs want advance tickets, contact TAF. Even if you can't come, buy a ticket, fill out the address portion and mail it in. It will be included in the drum for the Grand Prize Draw - think of it as a raffle ticket on a great Grand Prize!

PRIZES, PRIZES EVERYWHERE

ACE '92, the Atari Canadian Exposition to be held in Toronto on April 4th and 5th, will not only feature the latest in software and hardware, demonstrations and training sessions, but those who attend will walk away with thousands of dollars in prizes and awards.

All who purchase an admission ticket to either day of the Exposition and submit a filled out stub will be eligible for Door Prizes throughout the day they are attending. Although a complete list of door prizes is not available at this time, prizes will include software, hardware and a wide range of accessories. A sample of the kinds of prizes available includes four copies of the Essentials Set, a 5-disk collection of accessories and programs that all ST Users should have, from the TAF library. And once each day, a full year's membership in TAF will be awarded. A hard disk has been donated by ABCO Computer Consultants in Florida. Dorothy Brumleve has donated a copy of KidPublisher Professional, and Sudden Inc. is offering four copies of the student version of SuddenView. A Lynx II game and cartridge is the gift of Click Here, and Mission Software is

providing copies of Flash II, Printer Initializer, and lottODDS, a lottery selection program. Fair Dinkum's Crossword Creator II, Word Search Creator, and Cryptographer will be given away, as will EdHak 2.3 and Metapsychology Primer. The list goes on.

Besides making the entrant eligible for Door Prizes, each filled out stub will also be part of the Grand Prize Draw, the last event of ACE '92. The Grand Prize package is a complete computer set-up, including:

1) a Mega2 STe with a 50 meg hard drive and mono monitor, contributed by Atari Canada.

2) a Stow-A-Way computer table, a 30"x42" computer desk with a height adjustable base that fold for storage and an adjustable stool. Donated by Pi Precision Importing Inc.

3) The new Calamus SL, the outstanding Desk Top Publishing Program for the Atari. Donated by ISD

The ACE Talent Show is a featured event that will let Atari users display their creative skills in Graphics and the field of music and MIDI. From those demonstrating and performing on Saturday, April 4th, 3 finalists will be chosen in each division. They will be invited to attend the Gala Banquet on Saturday evening as guests of Atari Canada, and will again present their creations to the assembled banquet guests. A special panel of judges will then award the three prizes in each division:

1st Place - $700 Gift certificate and one year membership in the Toronto Atari Federation (TAF). 2nd Place - $200 Gift certificate and 10 disks from the TAF Library. 3rd Place - $100 Gift Certificate and 5 disks from TAF Library.

One of the Games Areas that promises to be busy throughout both days of ACE '92 is the LYNX CHALLENGE, where dedicated games players will compete against the computer, and where each day's high score will win a complete LYNX system, including AC Adapter and a selection of cartridges. All proceeds from the LYNX CHALLENGE as well as the GAMES TESTING AREA go to support Sick Children's Hospital, so in this area, truly everybody wins!

ACE '92 is co-hosted by the Toronto Atari Federation, a volunteer computer club. Over 100 volunteers will donate their time and energy to make this exposition and all its many activities take place, and Atari Canada has established a special prize for which only volunteers are eligible. All who work at least one shift for ACE '92 will be entered in a special draw for a A 1040 ST with a colour monitor that will be awarded just prior to the Grand Prize Draw on Sunday evening.

For an up to date list of those attending, exhibitor kits, display advertising rates, Talent Show entry forms or any other

ACE information, see contact information below.

GALA BANQUET WILL HIGHLIGHT ATARI EXPOSITION

One of the highlights of any convention is the chance to meet and talk with people who share interests. At a major international gathering like ACE '92, the leading creators of Atari software and hardware will be present and available. ACE '92, the Atari Canadian Exposition, to be held on April 4th and 5th, will bring together the outstanding dealers and developers in the Atari field for two days of seminars, sales and showing off.

Many times, however, the press of crowds and business makes it difficult to have the kind of in-depth talk one might wish. Developers are busy, crowds make conversation impossible, and the schedule of seminars and special events puts pressure on everyone. To help people spend more time together, a Gala Banquet will be held at the Skyline Hotel on Saturday night, April 4th.

A cash bar will open at 7PM, where participants can gather for drinks and conversation. Dinner will begin at 8PM, and will feature Filet of Beef Wellington with Madeira sauce, accompanied by Almond Beans, Carrots and Cauliflower. The Appetizer will be a Seafood Cocktail, followed by Tomato and Fennel Bisque. Dessert will be Fresh Berries Romanoff.

Following dinner, the finalists in the ACE Talent Contest will present or perform their entries. Selected from presentations made during the day, the top 3 in the areas of MIDI and Graphics will show off their creations on the Atari computer. Master of Ceremonies for the evening will be Geoff Earle, General Manager of Atari Canada, who promises that the evening will also contain surprises "not advertised in advance". However, he also promises that the program will not be long, so that people will have the chance to meet and talk and share their experiences. Following the formal proceedings, a special room has been set aside for ACE participants, so that conversation and celebration can continue as long as people wish.

Cost for the Banquet is $40 (Cdn) per person, which includes all taxes and gratuities. Tickets may be obtained from Atari Canada or from the Toronto Atari Federation.

DEADLINE FOR RESERVING BANQUET TICKETS IS APRIL 1ST. Because of the commitments to the caterer, tickets must be obtained in advance, and no banquet tickets will be available at ACE '92. It promises to be one of the highlights of the week-end, but it will require advance commitment.

ACE 92 will be held at the Skyline Hotel on Dixon Road, at Pearson International Airport. Further information, exhibitor's kits, advertising rates and advance ticket sales may be obtained by contacting:

1126. News-Disks and PD list

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-05 16:22:27 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar5.162227.23993@aber.ac.uk>
Source record: 112071

As promised a while back, copies of all 4 issues of my News-Disk are available at the atari archive. They are in a directory called "djg", and are called issue1.arc ... issue4.arc.

I will try and post (or get somebody to post for me) some of my PD disks to the archive. I have a lot of disks which don't seem to be in the archive. I could post all 116 of them if somebody wanted them! Lots of them came from PD suppliers in the States, some were written by users in the UK, and quite a few are by me. I have included the full catalogue at the end of this message. Let me know which disks you'd like to see uploaded to the archive.

Dean Garraghty. djg0@uk.ac.aber

Public Domain Software 1992

The Public Domain software listed here has been collected from around the world, and quite a bit of it has been written by me and other users in the UK. The prices shown include the cost of the disk, 1st class postage, protective packaging, and any duplicating costs involved.

All disks are for the Atari XL/XE. Please check disk density. Single density will work on any drive, but double density will require a 1050 or equivalent. On double sided disks, the reverse side can be used by turning the disk over, and inserting it "upside down". This does in fact work with the XF551 drive (despite what I've said on earlier issues of this list!!).

NOTE: any disks using sampled music/sounds/speech, do not need any special hardware to run. They run under software control.

ALL DISKS ARE 2pounds EACH. DISKS MARKED WITH A "*" INDICATE THAT A PRINT-OUT OF THE MANUAL IS AVAILABLE AT 1pound EXTRA.

PD1 - long digital music demos. This disk contains 4 edited sampled music demos. The music was sampled from the actual recording, and has been re-mixed to play up to 1 1/2 mins. This disk is double sided, and single density, and contains: Star Trekin' and Equinox, as well as two mixed demos. Also included is the 'phone demo. Here a telephone rings 5 times, and then a droopy voice says:"It's for you-oo!".

PD2 - the Programmer's Speech Tool (P.S.T). This disk contains 14 speech samples that can be used in your own BASIC programs. The disk contains extensive documentation, all the samples (E.g. "great score!", "hello"), runner software, and a demo of its use. This is a single sided, single density disk.

PD3 - the music machine. This is a very early digitized sounds manipulator by me. It is very simple, but allows you to use the 19 digitized sounds supplied to be played using the keyboard or joystick, and also has a very simple editor for creating runable BASIC code. The disk may be a good introduction to digitized sounds, but Digi-Studio is recommended for more serious work. This disk is single sided, and double density.

PD4 - the "this and that" disk. This disk contains something for everyone. It contains some graphics demos, an adventure, a maze game, 2 new versions of DOS (compatable with 2.x), a share buying simulation, a sound fx program in Turbo-BASIC (Turbo required to run this program), some music, and a demo created with D.M.S (not required to run this program). This disk is single sided and single density.

PD5 - Dean's Desktop System (DDS). This is a simple (very!) operating environment. It is based around a main section, and has a calculator, real-time clock, a diary, a simple database, and its own DOS. This disk is single sided, and single density. This disk was shareware, but is now P.D. Written in Turbo-Basic which is supplied on the disk.

PD6 - long digital music demos #2. Another disk similar to PD1, but with new music. This is a single density, double sided disk, and contains: Relax, The Bill, Don't look back, and 720.

PD7 (*) - D.S.I.L. Another program for using digitized sounds to create music. It is more advanced than PD3, and is a language based version. It contains the language(only a few commands!), a compiler to turn tunes into BASIC, and a keyboard player. It also contains samples, and demo tunes, as well as an on-disk user guide. This was originally a commercial program, but now is in the P.D. It comes on a DS/DD disk.

PD8 (*) - Education disk 1 (counting and maths). This disk contains 6 educational programs designed for children just starting maths. Most have digitized speech. They introduce methods of counting and maths by using storylines to get the child involved. This is a SS/SD disk.

PD9 - "this and that" 2. Another disk full of all sorts of programs. Included are more graphics and sound fx demos. Also included is "framewords" - a game based on the T.V. quiz "the frame game", Mathquiz - a maths tester with software speech, Tables - to test the times table, Test card - to help adjust your T.V., XR40 - a new text reader, Numbers - a strategy game against the computer (a contribution from another user), ATAFLEET - a great demo from a BBS, and Appliance calculator to work out how much things cost to run. All this comes on a SS/SD disk.

PD10 - BBK art. A great PD arts package. Loads koala and other format pictures. Has many features found in expensive commercial packages. Loads of koala format pictures are included, including many from commercial games, and also a few fonts. SS/DD disk.

PD11 - APAC (Any Point Any Colour) demo disk. Loads full colour, full shade pictures (up to 256 colours on screen at any time). Includes loads of pictures. Note: some pictures not suitable for viewing by children. DS/SD disk.

PD12 - Music&graphics demo disk. Contains a few great graphics and music demos in machine code. Loader included. Note: some demos not suitable for viewing by children. DS/SD disk.

PD13 - Graphics demos written in both Basic and M/C. Also a few with music. Menu loader included. DS/SD disk.

PD14 - Voice Master demo disk. A demo disk of the Voice Master digitizer system. Contains a talking calculator and keyboard, as well as a couple of other demos. SS/SD disk.

PD15 - Parrot demo disk. This is the demo disk for the Parrot II sampling system. It contains some demo music, which is superb! On the other side is a Max Headroom demo. DS/SD disk.

PD16 - DOS XE. The latest official Atari DOS, which supports the XF551 (in double sided!!), and all other drives. On the other side is a mod. for SpartaDos 3.2d, which will allow high speed using the XF551 when used with SpartaDos. NOTE: this disk has no docs. for DOS XE. DS/SD disk.

PD17 - Games 1. At last a games disk in my library!! This one contains a Karate game on side 1, and Cave pac-man, Fortress, Scramble, Hoppo, Pogo, and Wordfind on side 2. DS/SD disk.

PD18 - DOS 4. This DOS was developed by Atari for use with DS drives. It is now PD. It has all the docs. on the disk. DOS 2 disks will need converting to DOS 4 format (convertor on disk) before use. This is quite a nice DOS, and well worth a try. SS/SD disk.

PD19 - Digitized graphics #1. Contains loads of mode 9 graphics pictures, with a viewer and printer for Epson printers. This disk contains loads of pics. from Moonlighting and ALF. It also has a few others. Note: some pictures on this disk are not suitable for viewing by children. DS/SD disk.

PD20 - Games 2. Another disk full of games. Contains Crazy Egon, Jack the digger, Smurfs, Big quest, Kung Fu, and loads more. DS/SD disk.

PD21 - Utilities 1. A disk full of utilities. Has GOS (like a small desktop system), Koala dumps, a couple of utils. for the 1020 plotter, ramdisk utils., graphics convertor, disk RPM measure, and loads more (too many to list!). DS/SD disk.

PD22 - Dong/Crockford demos. Demos from these two famous Lucasfilm programmers. Contains some great demos. DS/SD disk.

PD23 - Basic music&Hanover show. Side A contains a few music demos written in Basic. Side B contains a graphics and music demo from the Hanover show (good stuff!). DS/SD disk.

PD24 (*) - Pryzm. This is a new 256 colours arts package. This version is only a taster. The full version sells for $15.00. Contains all doc. files. Note: The screen flickers during use because of the interrupts. It will probably be the same on the full version. DS/SD disk.

PD25 - Digitized graphics #2. Another collection of mode 9 graphics files. Contains all sorts, including: teenwolf,Whitney,Farrah, Pee Wees play house and lots more! SD/DS disk.

PD26 - Utilities 2. Side a has lots more docs. for Turbo-basic. Side b has MEC-DOS, a command DOS based on MS-DOS. DS/SD disk.

PD27 - More music/graphics demos. Some in Basic, some in M/C. A good collection! SD/DS disk.

PD28 - Games 3. More games including: Awari,Biker Dave, Boxin, Dark star, risky rescue, and lots more. Note: some of the games on this disk require a translator to run on XL/XE machines. DS/SD disk.

PD29 - The journey into sound demo. At last, another PD disk by me! This is a DS/DD disk crammed with digitized music and sounds. Contains: Ghostbusters, more 720 degrees, Eve of the war, and lots more!

PD30 - Side A of this disk contains Video Jukebox. This plays Pokey Player tunes (loads on the disk), while it displays pictures from many different formats, and converts them to other formats. Side B contains picture bender, which loads picture files (some on disk), and allows you to do strange things with them (good stuff!!). This is a DS/SD disk.

PD31 - Side A of this disk contains TETRIX, which is a great version of Tetris (the make-the-lines-out-of-shapes game). It is, in fact, a shareware program, and invites you to make a donation to your local group/club. Side B contains the "bouncing ball demo", by Bob Armour. This is a superb demo, and really shows what an Atari can do! This is a DS/SD disk.

PD32 - DAISY DOT III. This is a new updated version of II, and is SUPERB. This version can be customized at the press of a key to work with: Epson, Star SG/10X, C. Itoh, Mannesmann-Tally 9-pin graphics printers, and even the trusty old Atari XMM801! This disk contains the print program, a font editor and customizer, all docs. and 9 fonts. Quite simply, if you have one of the printers listed, then you NEED this disk. This version is the shareware version. A full version with even more features is offered from the author for $25. This is a DS/SD disk.

PD33 - Antic AMP demo. This is a demo disk for Antic magazine by Price/ Gilbertson. BRILLIANT!! On side 2 is a German version of DOS 2.5 (I'm sure you'll find a use for this!!). This is a SD/DS disk.

PD34 - Digitized graphics #3. Another collection of mode 9 pictures. This disk includes miss piggy, Monroe, and loads more. This is a SD/DS disk.

PD35 (*) - GIF v2.0. This is the Atari version of the Graphic Interchange Format. It allows you to download pictures for other computers, and convert them for use on the Atari. The disk contains quite a few pictures, and loads of docs. DS/SD disk.

PD36 (*) - Textpro 4+. This is the latest version of this great PD Wordprocessor. All docs. are included on the disk. SS/SD disk. The manual for this disk is very long, and so a print-out will have to be 1.50.

PD37 - Utilities 3. This is a disk full of utils. for the 1020 plotter. I don't own one of these, so I can't say what they all do, but there are lots of them! DS/DD disk.

PD38 - Digitized graphics #4. Another disk full of digitized graphics. This disk takes a slightly different format to the others, because this one was written by a user here in the UK. They could be printed out using the loader on the other 3 disks. Pictures include lots of film pictures, Mrs.Thatcher, and lots more! DS/SD disk.

PD39 - Pictures/HTT demos. Side 1 of this disk contains lots of pictures by the same author as PD38. These are not digitized, but are great to look at! Side 2 contains some new demos from the high-tech-team and tron. Good stuff! DS/SD disk.

PD40 (*) - ANALOG programs. This disk contains various programs from ANALOG magazine, which we believe are now PD. The disk contains something for everyone. A few M/C games, a spelling checker, and other utilities. A doc. file is on the disk. A fine collection. A MUST! DS/SD disk.

PD41 - SEEPIC/Picture Pirate. Another disk full of pictures. Side 1 contains various pics. Side B has pictures taken from games. DS/SD disk.

PD42 (*) - Snapshot. This disk allows 130XE (or upgraded 800XL) owners to use their extra 64K as a 2nd computer. You can then run applications in one "computer", and switch to the "other". A doc. file is included, but note this disk is by no means intended for novices, and you will need a fair knowledge to be able to use this disk. SS/SD disk.

THERE NOW FOLLOWS A LARGE SELECTION OF GAMES DISKS, WHICH ALL TAKE THE SAME FORMAT. THEY ALL HAVE A MENU ON THE DISK, BUT HAVE NO INSTRUCTIONS, EXCEPT WHERE SUPPLIED IN THE PROGRAM. MOST OF THE GAMES ARE WRITTEN IN BASIC, BUT SOME ARE IN M/C. NOT ALL ARE ARCADE. SOME ARE ADVENTURES, AND SOME ARE MIND GAMES. ALL ARE DOUBLE SIDED, AND SINGLE DENSITY. THERE MAY BE SOME GAMES WHICH APPEAR ON MORE THAN ONE DISK, AND SOME GAMES MAY BE ON PAGE 6 DISKS. I APOLOGISE FOR THIS, BUT IT IS VERY TIME-CONSUMING TO TRY AND TAKE THESE OFF. SOME GAMES MAY REQUIRE A TRANSLATOR TO RUN. SOME DISKS APPEAR TO HAVE FAR MORE GAMES ON THAN OTHERS. THIS IS BECAUSE SOME GAMES TAKE UP MORE SPACE THAN OTHERS.

PD43 - Games 4. Contains: submarine, devils, convoy, goldrush, missle1, invader, landern, missle2, gun fight, surround, orbits, robot war, black jack, frog, adventure, word square, maze 3D, paddle ball, pro bowl, tank trap, leprechin, snakes, wild west.

PD44 - Games 5. Contains: chicken, battle field, word, maze, yahtzee, mug wump, quest, big boggle, catacomb, saucer, clewso, speedello, change, simon, eight ball, baseball, guess, polock, dragon maze, golf 1, slots 3, golf 3, defend.

PD45 - Games 6. Contains: sterwarp, game pack 1, munchin, moonland, myriapede, what is it, crash dive, close out, galactica, target shoot, slalom, ant wars, buzz zap, castle, thunder bird, dragon adv., juggler, baricade 3.

PD46 - Games 7. Contains: harvey, racer time, balloons, bank shoot, filler-up, slots 1, star blaster, tag game, midnight race, word search, wizard, star trek, death star, battle ring.

PD47 - Games 8. Contains: leyte, dungeon, sabotage, slot 2, solitaire, outspace, gold mine, K-byter, maniac, backgammon, adventure in 5D, cat n mouse, kismet 2, darts, bee trap, tune in, tron, numbers.

PD48 - Games 9. Contains: space rescue, pharaoh, sherlock, flip-it, I.B.C., hex-a-pawn, speed demon, star gazer, knight battle, super chase, titanic, stunt clown, laser barage, doggies.

PD49 - Games 10. Contains: hangman, arrow one, birthday, poker, doctor, stunt man, survive, cannon, othello, piazza, volley, hello, wumpus, treasure, maze man, challenge.

PD50 - Games 11. Contains: blue berrys, bounce ball, chutes, code master, gambler, boggler, bumper pool, circus, eggs, simon, horse race, gotcha, knights, laser, jumper, master mind, golf, K-bytes, hanoi, live wire, jumping, lumber jack.

PD51 - Games 12. Contains: riskey, siege, monopoly 1, norad, maze race, midway, motie, olympiad, pentomin, quatrain, retofire, take 5, one, space miner, star sector, superman.

PD52 - Games 13. Contains: tanks, titan, roulette, tiger hunt, rebound, rock slide, bellvue, prison breakout, bomb squad, pop, poker squares, laser strike.

PD53 - Games 14. Contains: air hockey, biker dave, bonk, high rise, hangman 2, elevator, zip, balloon, suprise, bowling, black friday, electroids, last war, stud poker, snake, sky scape, yahtzee 2, trivia time.

PD54 - Games 15. Contains: video poker, space ace, lunar patrol, nuclear waste, lunar lander, trivia master, tag, tic-tac-toe 3D, clash of kings, crickets, terry, treasure, cliff hanger.

PD55 - Games 16. Contains: cosmic glob, death zone, five card stud, moonbeam arcade, crazy 8s, dinner, astro war, warrior 3000, M.C.V.Q., megalegs, wumpus 2, word jumble, mister m, desert chase.

PD56 - Games 17. Contains: frantic pinball, fortune wheel, F.wheel.gen., worm-be-me, animal guess, pegasus pinball, lost, ionpower pinball.

PD57 - Games 18. Contains: bomb, empire, flyer, montie, stingray, terminant, volcano, wari, chomper, creation, dungeon, galactic trader, super vision, vectron.

PD58 - Games 19. Contains: camel, civil war, one on one, risk, bumble bee, tic-tac-toe 3D, space dodger, bowling 2, nevada 21, ace ducey, dungeon arcade, battle field, miami ice, martesoro, dodge racer.

PD59 - Games 20. Contains: kidnapped, euchre, chess, warships, canfield, blackjack 3, switch box, tight rope, tugawar, blackjack 4, chess, monopoly 2, sea war, tyrants, bombrun.

PD60 - Games 21. Contains: air defense 2, quest, sea wars, battle ship, avoid 2, air raid, star dodger, money hungrey, bombers, planet, rain storm, space race, blondel, two gun, cosmic war, snowflak, air defense, blaster, caves of ice, hawkmen, hookey, loneaglerev, bingo, jackpot, cylons, wormsquirm, avalanche.

PD61 - Games 22. Contains: space thief, xword puz, firebug, bacterion, olympic dash, star crystal, blast, blue thunder, galactic, insects, gauntlet, race in space, snowball.

PD62 - Games 23. Contains: quest 2, titan32K, titan40K, numrace, jalopy, angle cannon, animal, arena, assault, astron, epsilon, horsplay, creepy, dragon, astrostm, blackjack 2, bunny hop.

PD63 - Games 24. Contains: grubs, gunfight 2, maze maker, quatro, rambhi, rambug 2, rebound kit, slither, starlane, tax man, vultures 3, backgammon, devils door, final orbit, laser, midas, poker 2, remember.

PD64 - CPR tutor. This was once a commercial program released by Atari, but is now PD. It shows, with EXCELLENT graphics and animation, how to perform CPR. A MUST for all those interested in learning this life-saving technique. DS/SD disk.

PD65 - More music and graphics. Side 1 contains and auto-running demo, with amazing music and graphics, all in Basic! Side 2 contains some more various pictures from films. DS/SD disk.

PD66 - Movie Maker disk 1. Side 1 contains some movies created with MM. Viewer included. Side 2 contains a simple PD version of MM, using character graphics. DS/SD disk.

PD67 - DRAW 7.1. This is a powerful graphics program for the 130XE and upgraded 800XLs only. DS/SD disk.

PD68 - Utilities 4. This disk contains diagnostic programs for various pieces of Atari hardware. Also included is DOS-WIZ. DS/SD disk.

PD69 - Utilities 5. Side A contains Title Screen Creator, for creating title screens for disks. Side B contains the A65 macro assembler. Note: This side has no DOS, so that all the files could fit. DS/SD disk.

PD70 - Education 2. A mixed bag of educational programs. This disk has: wordsearch, lazertype, typing, states, americas, world, algegrap, polargr, math, math2, power2, metrics, astronom, plotfunc, typing.trn, music.dmp, chemquiz, contractors, hamurabi, sinplot, question.fmt, number catch, nature, kilowatt, geometry, guessmy, loomweaver. DS/SD disk.

PD71 - Education 3. Another mixed bag, containing: mathman, reading, mathatak, word scram, spanish, number game, speed read, alphtrn, fun with words, math3, marathon, spell blast, typeing.les, scramble, counting, airattk. DS/SD disk.

PD72 - Education 4. Another mixed bag, containing: engineer, civil war, power, copycat, wordsqr, typtch, visionex, mathsub11, shapese24, uwordse25,

lwordse26, uletter23, lletter21, numbers22, mathadd12, recall. SS/SD disk.

....STOP PRESS.....STOP PRESS.....STOP PRESS.....STOP PRESS

NEW OFFER: ANY 10 PD DISKS FOR 15pounds.

PD73 - Pictures. Side A contains some great mode 8 pictures which have been ported over from an ST. Side B contains some 256 colour pictures. DS/SD disk.

PD74 - Colour pics./game design disk. Side A contains full 256 colour digitized pictures, but please not that these are in no way suitable for viewing by children. Side B contains a great on disk tutorial on how to write games. Many examples of techniques are included, as well as a couple of games! DS/SD disk.

PD75 - Don't Ask demo/more pictures. Side 1 of this disk contains the Don't Ask Software demo disk from 1983 (the company famous for S.A.M.) It contains demos of all the products (all now long gone) they used to sell, including SAM. The best demo is of SAM trying to sing the US National Anthem (you've got to hear it!!) Side 2 contains some more pictures files with a viewer. DS/DD disk.

PD76 - Utilities 6. Side 1 contains Sector Surgeon, a utility for modifying sectors of a disk. Easy to use. Side 2 contains Howfen menu. This contains an XL/XE translator, and a few disk-disk, tape-disk transfer programs. DS/SD disk.

PD77 - Hobby Tronic '89 demo. DS/SD disk full of good graphics and music. Note: this is NOT the same HT disk as in the Page 6 library.

PD78 - WITHDRAWN

PD79 - WITHDRAWN

PD80 - Steve Dong/Movie-Movie. Side 1 contains more Dong 256 colour pictures. Side 2 contains some pictures from films. Note: Some pictures not suitable for viewing by children. DS/SD disk.

PD81 - DETERM 1.55b. Very good comms. package for use with modems. DS/DD disk.

PD82 - Script80/DVC C. Side 1 contains a good word processor which works in 80 cols. on normal TV/Monitor. Needs translator for use with XL/XE. Docs. included. Side 2 contains the shareware version of DVC C. This is a very good implementation of the C programming language. DS/SD disk.

PD83 (*) - BASH-A-DRUM/RAIN COMES DOWN. Another contribution from me. Side 1 contains BASH-A-DRUM, which is a drum sequencer with pattern and song editors, and keyboard and joystick drum players. With demo files and full docs. (Will need W/P to print this out). Side 2 contains a digitized music demo, similar to those on PD1,6, and 29. DS/SD disk.

PD84 - Printer utils./Misc. Side A contains a load of printer utils. Some don't require any special printer, and some are for Epson, and even one for

the 1020. It contains biorhythm, calendar makers, lots of different label creators, various screen dumpers, an loads more. Side B contains various bits and pieces, a few pictures, a couple of demos, and M-Windows, a great M/C windows system for the Atari. Note: side B hs no DOS on so that I could fit it all on! DS/SD disk.

PD85 - Char Editor/ Synfile tutor. Side A contains a fantastic character editor written in Action! You can edit up to 8 fonts at once, and even animate them! This is the best editor I have seen. Has an on-disk tutor. Side B contains a running tutorial for Synfile+. DS/SD disk.

DON'T FORGET : ANY 10 PD DISKS FOR 15pounds.

PD86 - ITeC demo/Music Menu. Side 1 of this disk contains the ITeC graphics/ sound demo, which is a great collection. Side 2 contains a utility for creating musical machine code loader menus. Lots of music is supplied on the disk (mainly taken from games), which can also be listened to without having to use the utility. Also on this side is the Rob.C menu maker and DISKY II. DS/SD disk.

PD87 - Fortress/Atartis. Two new versions of Tetris. One with background music. Very good versions. DS/SD disk.

PD88 - Digitized #5. This disk contains more digitized pictures, but are X-rated. Note: Not suitable for children. DS/SD disk.

PD89 - Videoblitz/Virtuoso demos. This disk is for the 130XE only. Videoblitz is an amazing graphics demo that has to be seen! Side 2 contains some animations done with Virtuoso. DS/SD disk.

PD90 - VT100 terminal emulator. Needs translator for XL/XE. DS/SD disk.

PD91 - AMS music disk#1. Two sides of music done with the Advanced Music System. Various music. Loader supplied. DS/SD disk.

PD92 - AMS music disk#2. More music, but this disk has no player on. Will need PD91 or 93 for the player. DS/SD disk.

PD93 - AMS music disk#3. More music, with player. DS/SD disk.

PD94 - Pixel artist. Nice graphics drawing program. SS/SD disk.

PD95 - Autocare. Disk for managing your car. Contains details of cars, and lets you keep a database of models. Also help with running your car. This is an American disk so may be of little benifit to you. DS/SD disk.

PD96 - Wizards cottage/crossword puzzles. Side a contains a text adventure, while side b contains lots of crossword puzzles. DS/SD disk.

PD97 - Top-DOS/sector copier. Top-DOS is a new DOS which also works in Happy warp-speed, and has lots of other features. On disk help is available, but note that this DOS is in no way intended for beginners. Side 2 contains an easy to use sector copier. DS/SD disk.

PD98 - Games 25. Contains: blackjack,yahtzee, 3D tic-tac-toe, carny, and bowling. DS/SD disk.

PD99 - Utilities 7. Track Stack allows you to maintain any 2 M/C programs on the track stack disk. Docs included. Also: Keyboard macros, graphics drawing program, a good graphics file format converter, disk editor, char. display utility, a new DOS, and ultra-transfer. DS/SD disk.

PD100 - The Digital Editor. A great simple DTP-type package. Has fonts, pictures, printer dumps, and instructions. DS/SD disk.

PD101 - Music. Two sides of music with a player which lets you alter the sound. DS/SD disk.

PD102 - Utilities 8. Has sector surgery, joytest, keymaster, colortest, text file formatter, super Arcmate, calculator. DS/SD disk.

PD103 - Traverse/force of 4. Traverse is a great chinese chequers type game with instructions. Force of 4 looks good but I can't work out what to do! DS/SD disk.

PD104 - PC Pursuit 2.0. Terminal Emulator for MIO/850/PR. DS/SD disk.

PD105 - Wedge 2.1. Adds 20+ new commands to SpartaDOS 3.2d. Needs 128K and sparta 3.2d. DS/SD disk.

PD106 - Games 26. Another good collection of games. One side contains the following Basic games: Burgers, Spy Plane, Epsilon, Jackpot, Lunar Patrol, Rafferty. Side 2 contains the following MC games: Avalanche, Bacterion, Bonk, Canyon, Charlie, Demon Birds, Froggie, Insects, Livewire, Lunar Defender, Nordic Ski, Olympic Dash, Rainstorm. This disk is from France, so the docs. are in French. They are quite easy to play though. Most are taken from Analog, Antic and Atari User (old). DS/SD disk.

PD107 - Games 27. Side A contains the excellent Atomit. You've got to make up molecules out of bits in limited time. On side B are a good collection of M/C games: Shooter, Capital, Mazerun, Secret, Clown, Krazy, Froggy, Canyon, Climber, Starride, Trial. DS/SD disk.

PD108 - GOS demo/Shiny Bubbles. Two treats for 130XE (or expanded 800XL) owners. Side A contains a demo of Diamond GOS. Side B contains a superb graphics demo which would rival any computer! DS/SD disk.

PD109 - Ultra Tetris/Draw Apac. Side A contains a new version of Tetris, where you have to match colours. It is written in Turbo-Basic (copy on disk). Side B contains Drawapac. This lets you draw your own 256 colour APAC pictures, and also lets you load and modify APAC pictures. Side A is a shareware disk, with a reccommended fee of $10. DS/SD disk.

PD110 - Extended Basic/Glyph font editor. Side A contains an extension for Atari Basic, adding loads of new commands and features, with on-screen clock, cursor controllers, DOS commands, and loads more. Has big doc. file on the disk. Side B has a font editor and convertor, with some fonts. This side is shareware, with a reccommended fee of $10. DS/SD disk.

PD111 - Movie Maker movies. A disk full of moviemaker movies. Comes with movie player for viewing. DS/SD disk.

PD112 - Jeopardy!/Card Games. Side 1 of this disk has Jeopardy!, a game based on the US TV series. Side 2 has various card games, mainly versions of poker. DS/SD disk.

PD113 - Binary Games/Ramblin Gamblin. Side 1 has: Battle, Tron, Smasher, Insects, Fillerup, Roundup, Hoppper, Canyon, Cosmos. Side 2 has Ramblin Gamblin which contains: roulette, 5 card stud, slot machines, blackjack, and horse race. DS/SD disk.

PD114 - SOS Mangam. This is a double sided graphic/text adventure, which takes up a huge amount of disk space so has lots of screens. DS/DD disk.

PD115 - Fig Forth 1.0D. This is an implementation of the Forth programming language. It comes on 2 DS/SD disks, which includes the M/C source listings for it, lots of docs. and tutorial files, and lots of Forth programs. This will be sold as a dual disk pack at 4pounds (usual bulk purchase discounts apply - just treat this pack as 2 normal PD disks).

PD116 - Megablast 128K. Another contribution from me. This is my first 128K digitized music demo, and so requires a 130XE or upgraded 800XL etc. The music is Megablast by Bomb the Bass. SS/DD disk.

Don't forget:

Any 10 disks for 15pounds
Any 20 disks for 25pounds

1127. Please put DOS 2.0S on the archive so I can cc65

Hello loyal 8 bitters,

I have just re-entered the 8 bit world and have been trying
to get back to speed.

I am working on an interfacing project which requires a language
that will let me do bitwise AND, OR and basically get low level.

I have tried getting Frost Basic but it seems a bit mangled. I am
using util.exe from the atari.archive which is bugged so I will try
to bring it from the IBM one or two more times before I give up...I
definitely have all the telecommunications straight now.

I also tried getting CC65. It won't run under Mydos or DOS XL.
I have a 48K Atari 800 only. Apparently cc65 loads at $2800. It
is 149 DD sectors long. Assuming 254 bytes per sector (2 byte links)
and assuming a contiguous load, that puts the end address at $bb00 or
so. Memory ends at $bfff on my homely 48K machine. When I load
from DOS XL, I get the CC65 prompt but it complains of memory
problems when I try to compile hello.c. When I try to load from Mydos,
it just loads in dup.sys immediately after. I have dos 2.6f (hacked
2.0s) and it won't load with it either. It wants a mem.sav with 2.6f
which doesn't help matters anyhow. I tried renaming cc65.com to
autorun.sys for both mydos and 2.6f to no avail. I also deleted
dup.sys on both doses to no avail.

I sent a message to infoatari8bit (or whatever) and got in touch with
the person who wrote cc65 (apparently). He says it will run on a 48K
Atari running plain vanilla dos 2.0s.

I have diskcomm, dskcom32 and shrink. I was hoping somebody could
compress dos2.0s (unmodified) along with any patch programs for
double density, etc, if possible. If you could put it on atari.
archive.umich.edu under atari/8bit as dos20s.arc or something I would
be much obliged. If somebody could similarly post dos2.5, that may
also help in the future.

Thanks in advance.
Sorry about the length of the post

Message-ID: <1992Mar5.193202.23758@u.washington.edu>
Source record: 112073

The "Yo Yogi" glasses are clear on the left and have a neutral density filter on the right (just kinda grey)

The 3D camcorder works on an entirely different system. It has two lenses on the front and alternates images on the screen. The Left and Right halves of the pair are seperated using LCD visors (Like for the NES)

I don't suppose anybody has tried using the Yo Yogi glasses on a video game yet? It should be good for anything where the motion is primarily from left to right(for the foreground). I would try it myself, but my Atari is sitting in the closet gathering dust right now.

What is a DSP56001? Well I am sitting in front of one now and
in fact it is generating realtime additive synthesis in CD quality
stereo sound.

It is a really cool little CPU. It has nothing to do with video, it is just
a CPU. It is a 24 bit CPU in fact, has multiply add and divide operations,
very flexible addressing modes, a built in sine function table in ROM,
also a u-law table.. this is a logarithmic scale table used for the
CODEC standard of storing sounds.. CODEC is the standard used for digital
telephone voice transmission. It uses an 8012Hz sampling rate, has 5 bits
mantissa and 3 bits exponent, for noisy 12bit sound.
It has separate X and Y memory architechture so that data from two sources
can be read simulataneosly and operated upon. It has lots of regissters.
It's very fast and can do real time FFT and all sorts of things.
I don't know what else to say, if you're interested in any particular aspect
of the chip I can let you know. I also have a text file explaining all the
instructions briefly.
This is a chip used in modems for signal processing, in synthesizer keyboards,
in add on boards for many computers, in CD players for digital filtering
and so on.

Message-ID: <1992Mar5.155851.4004@ac.dal.ca>
Source record: 112101

Re: 4096 digi's

Well, accessing files is not a problem.. I have a video digitizer here (from
VCR or laser disk), but besides that I have many beautiful raytraced pictures.
In fact I have already made a few 320x200x4 greyshade GIFs so I could see
what they looked like on my 64. I could create a nice 256 color GIF, or,
better yet.. give someone a nice pic in a simple file format they can easily
decode. I can use PBM format, portable bitmap format.. this is used by a
pd file conversion program that is available on the net. It is in C code
and I have ported it to an Iris workstation.
I can scale the file to any size and dither it in color even.
So if someone is interested in writing a display program I can give you some
files.

The diskette that came with the MIO had a low-level format utility...
you would use the MIO to partition and format each partition...do not
allocate sector 0 to a partition because the MIO uses this sector to
store its configuration...

Source record: 112100

I could ask Atari about it on Atari Base (once I figure out their damned new software!). I asked if they'd sell the rights to it to a company or something, because they've ended their support, but they said that "they still sell pretty well in European countries".. I said "yeah, but how many years does someone over there have to work to afford one!?".. (saw some note of that sort in AE or ANTIC or something...)

As for the 130xec (the card), it seems to be in a very developmental state. I recall that I heard about it on the ICNet on the carina II place around here (WCS), but they died, so I can't reach that net. I think ABase is on Z*net now, so anyone on it can possibly reach Atari. Try for Bob Brodie.. he's been "taking the helm" there since they decided to get the new software.

As for posting Atari uuencoded stuff.. why don't we add a group called "alt.binaries.atari.8bit", sorta like the apple, amiga, ibm, etc. "news"feeds?? And then have a "a.b.a.8.discussion" newsfeed, so people who aren't on usenet (those on CI$ or wherever) won't be confused about statements like "get this demo", etc.etc.

How's it sound??

1134. Having cart.port problems

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-05 22:50:43 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <9mq7gB6w164w@cyberden.uucp>
Source record: 112104

I usually have my cart.port on my 1200xl empty, as I only use Binary stuff, and never use ataribasic, just Turbobasic now. The thing is, that whenever the cart.port's empty, almost every time I try to boot up, I get this brown colored screen and have to press [RESET]. Is this just another one of the "many" 1200xl quirks??

Also, yesterday I was bored and tried to stick Joust in my port, and it stuck. It felt as though either the cart wasn't opening up for the computer's "pins" (the plastic things that push old 400/800/xl carts. open). Or maybe it IS my cartridge port. Because of the tiny amount of space on my desk (2" from wall of desk -> computer, 2" from computer to 1050 and 2" from 1050 to other wall), I usually "jossle" the carts. left and right to remove them. Is this damaging it? I've never had much problems with my port until lately....

Thanks alot!

1135. xmm801 parts!

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-05 22:56:09 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <awq7gB7w164w@cyberden.uucp>
Source record: 112078

I really need a new paper roller knob and new cover (mine looks like patchwork!) for my xmm801 printer. Does anyone know where I can get parts? (should I try Atari!? as if they'll care or something!)

Also, speaking of dead hardware... why did Atari ever come up with the 9-pin SI/O ports? Was RS232 not around back when this was designed? (Atari's ARE older than IBMs!..hehe...)

And... what do you think would've happened if Atari computers didn't have the name Atari? (hence people thinking "Atari? Atari COMPUTER? They made one?.. What, does it play Pong!?" when I say what computer I have...) My friend used to say that it probably (or was it the ST) would've done a lot better if it wasn't associated with the 2600 and Pong.. (even though they ARE AWESOME..(not HIS opinion..mine! :->))

Well?

Thanks in advance! Bill

Message-ID: <wFw7gB2w164w@cyberden.uucp>
Source record: 112102

Ok.. you've all played games that are probably compressed. You know, the games with huge background maps (Zybex, Mirax Force, Boulder Dash). Somehow they fit all of this, plus game code and sounds (music or voice) into my little 48k on my 1200xl. How!? I'm guessing it's compressed. Well.. I'm wondering what type of software is needed for good compression of this type of data. I had an idea for an english language compresser (change all the letters/letter combos (-ing, ed, etc.) to 1 byte or less sized values.. sorta the opposite of uuencoding...)

I'm just interested for a good compression program that can be added to basic (ie basic code or a USR-able routine). I think it's great to be able to only load a game once and never need data disks! thanks..

Message-ID: <50571@mimsy.umd.edu>
Source record: 112092

I have a 410 Taoe Drive for sale, it is pretty beat up, but still works,
I am asking for $7 + shipping, I will throw in about 30-40 tapes, but I
don't know how many will works.

Also, A couple of carts for sale:

Speedway Blast by IDSI
Kick Back by Thorn EMI
Mountain King by CBS
Squish 'EM by Sirius

no manual, just the cart, asking $3 each, I pay shipping.

All carts should work on 400/800.

Please email hong@tove.umd.edu if interested.

Thanks,
Sze Hong

1139. DeTerm

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-06 07:43:38 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <FBF8gB2w164w@cyberden.uucp>
Source record: 112091

I'm using DeTerm right now. It is a most excellent program. Almost better than BobTerm. I'd like to see a mix of it and BobTerm! That'd be really cool! I just got Bob Puff's UnLZHer today, as well! I didn't know there WAS one! It's verion "0.1", though, too. I forget what the date said, and I don't think that it can actually LZH a file. Does anyone have UnLZHer? How about LZHer!? Has one been made yet??

Also, does anyone have a good PD font editor? Somebody on a BBS near here is looking for one, and I said I'd upload my Basic one ("Font3.1"), as I have no others (other than my earlier, far weaker versions.)

I'm hopefully soon going to re-start work on Font 4 again. This time it'll be in TurboBasic XL, and can handle far more than 1 or 2 fonts at a time (it's only 1k per font! What was I thinking!!) I'll also hopefully have designed a WORKING <90 degree rotation routine! Hehe... Perhaps I'll wait until I can get my hands on Action! before I start getting into such hefty things!

Oh... BTW: my version of DeTerm is DeTerm SX version 1.59. I'm wondering why it cannot [TAB]. Instead of [TAB]bing, it [DELETE]s.. Is this DeTerm? My version? The fact that it's DeTermSX? Or is it DeTerms SX R:handler?

One last thing before I go.. Where is there a free 1k of RAM on BobTerm (1.21 on a 48k 1200 with MyDOS.. to be exact!) I'd like to make a ch-set switcher for it (just a module, actually.) Also, how can one keep MyDOS from reloading itself after it runs a program that does such a thing. If I have a program called COLORS.OBJ or something like that on a disk without DUP.SYS (or at least not a MyDOS DUP.SYS) and all COLORS.OBJ does is say "change the screen colors" (ie. it has the bytes:
255
255 (header)
708
712 (start/end)
xx
xx
xx
xx
xx (replacements to go to locations 708-712)
and that's it), when I run it, it successfully changes the colors, but then starts doing the annoying "beepbeepbeep" on drive 1, and then tries drives 2 thru 8 and does this over and over, because it can't find a drive with MyDOS on it! How does one keep this from happening!?!?

Thanks in advance for any info on any of this stuff! (determ/fonts/mydos binaries)

(darn it! I can't TAB!!)

1140. Re: need compression code

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-06 14:02:08 UTC
From: psteffn@gnu.ai.mit.edu
Message-ID: <9203062102.AA07215@geech.gnu.ai.mit.edu>
Source record: 112087

Hmmmm? Depackers on the 8bit? Well, they are quite commonplace on the ST and Amiga these days and I see the PC world has stolen the idea with PKlite and [I think this is the right name] LZ.. A generalized packer routine would be great for the Atari 8bit.. Particularly since I remember coming across LOTS of large files that contained lots of wasteful redundant data...

The idea is that you pack your code, tack on a small depack routine at the beginning, and whenever you load your program, this little depack routine depacks the rest of the code somewhere in memory, relocates it back to the original load address [sticking the return address is probably the best way on the 6502...] and executes as normal.. This would work great on expanded > 128k 8-bit machines only.. On a 64k machine, you might be able to write a smart algorithm to handle even 40k files but the 8-bit memory management [what memory management?] would make it awkward.

Although, for games, the best way is to just write a custom packer that may work best on maps.. I doubt you'd be storing the complete bitmap for a large scrolling map in your game [using a font and just a simple ascii table, as in most of the classic Antic games is the most efficient way]. Concerning how many possible ascii values you use in your table, you could probably do quite well with a simple binary tree algorithm. You could probably shrink a 40x40 map of 1600bytes to under 200bytes. The algorithm would be easier in assembly or Action! since I do not recall many bit operations in Atari Basic.

Anyway, the main reason I posted is that I want to get in touch with Null Cypher but my mail bounces. If you read this, mail me!

>I'll wait until I can get my hands on Action! before I start getting into
>such hefty things!

What's "Font 4?" Some of your projects sound REALLY GREAT, by the way,
Bill! Picking apart Expo91, writing Klix (hurry, hurry, I LOVE that
game Klax...), etc. etc... Bravo! :-)

>Oh... BTW: my version of DeTerm is DeTerm SX version 1.59. I'm wondering
>why it cannot [TAB]. Instead of [TAB]bing, it [DELETE]s.. Is this
>DeTerm? My version? The fact that it's DeTermSX? Or is it DeTerms SX
>R:handler?

None of the above! :-) Apparently DeTerm is transmitting raw ATASCII
code when you press keys, or at least when you press the TAB key. I
discovered many years ago that the Atari TAB character is ATASCII 127
decimal, NOT the "standard" ASCII 9 decimal. In ASCII, the value 127 is
the "DEL" character. So if you hit TAB on your Atari with DeTerm, it
transmits ATASCII 127; the ASCII host system receives this, says "aha!
127, that's DELETE," and acts accordingly, probably deleting the most
recent character input and moving the cursor one space to the left.
If you want to transmit a standard ASCII "TAB" (9 decimal) you should

be able to do it by typing control-I (hold down CTRL, press I). Now, if the ASCII host echoes that, and DeTerm displays the literal "ATASCII 9," you're going to SEE a "graphics character" which is really the ASCII host system's TAB character. Beware. Offhand I'd have to say that based on what you've said, I wouldn't use DeTerm to talk to an ASCII-based host system at all! :-)

>One last thing before I go.. Where is there a free 1k of RAM on BobTerm

Tech specs on BobTerm are pretty well nonexistent, unless someone reverse-engineers them; people have been pestering Bob Puff for internals info for YEARS in the interest of writing modules, but Bob has been very close-mouthed on the subject. I can well understand this, though -- he's got an AWFUL LOT of "irons in the fire," only ONE of which is the maintenance-and-documentation of BobTerm. I'd rather have him do what he can, than drop all other projects just to document BobTerm...

>Also, how can one keep MyDOS
>from reloading itself after it runs a program that does such a thing.

Can't help you there, although yeah, I've noticed this annoying behavior too...

BTW, you ARE all aware that you can load binary data from the E: device (screen/keyboard Editor) in DOS 2.0 (and maybe MyDOS, too, for all the good it will do you)? This is a happy consequence of the fact that you can generate all 256 (0 through 255) eight-bit data values directly from the Atari keyboard. As an example, here's how I do the equivalent of BASIC's "POKE 580,1" from the DOS 2.0 menu:

L <return> - select BINARY LOAD from DOS 2.0 menu
E: <return> - select Editor (E:) device as "file to load"
<DOS opens the "file" "E:", causing the screen to clear>
<type the keystrokes exactly as listed in the left column:>
ESC - prefix the following keystroke...
ctrl-INSERT - hex FF (255 decimal)
ESC - prefix the following keystroke...
ctrl-INSERT - hex FF (255 decimal)
D - capital D, ASCII 68 decimal, low byte of address 580 decimal
ctrl-B - control B, ASCII 2, high byte of address 580 decimal
D - capital D again (previous D, ctrl-B was START-load address,
ctrl-B - control B again this one is END-load address)
ctrl-A - control A, ASCII 1, data to be loaded into address 580
ctrl-3 - end-of-file

<control returns to DOS and the menu reappears. Youe POKEd the value 1 into address 580>

The same idea can be extended to load ANY data, program code, etc. etc. into ANY address(es) in memory...

moon!cyberden!phbill@well.sf.ca.us had the unmitigated audacity to say:
>
> [Asking about compression]
>
>Bill

I don't know how all those ARC things go (Crunch, Pack, Squeeze, Stomp, etc),
but here are a couple ideas.

If you have data with a lot of repeated bytes (like zero) you can do something
like this:

Text string " Boooo!"

Data:
6 spaces .byte 6,32
1 B .byte 0,1,"B" (0 = no packing, 1 = length, "B" = data)
4 o .byte 4,'o
1 ! .byte 0,1,"!" (see "B" above)

I believe one of the ARC compaction formats works something like that,
but it's probably structured differently.

Also if you have something like ASCII text, it will only use 7 of 8 bits,
so if you squash the bits together and have a 12.5% reduction.

If I were you I'd set up some test files with lots of repeated sequences,
ARC them, and see what the ARCs look like. Or maybe check out a library
book on compaction. Or wait for a post from someone who knows what s/he
is talking about...

1147. Eliminating MyDos's DUP.SYS from re-loading after running programs

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-06 21:49:44 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1992Mar6.214944.14384@magnus.acs.ohio-state.edu>
Source record: 112085

```
>>>Also, how can one keep MyDOS
>>from reloading itself after it runs a program that does such a thing.
>>
>>Can't help you there, although yeah, I've noticed this annoying behavior
>>too...

The way to solve this problem is to find the address of the prompting
or menu display routines within MyDos. Then it is a simple matter to
create a binary file to jump to the prompt/menu. This binary file is
then appended to the binary file you wish to jump back to the menu after
loading. This is dangerous, though, if the binary load file overwrites
DUP.SYS; in this case, the prompting routine may no longer exist! This is
the reason DUP.SYS is reloaded, so that exiting from programs which use
the same RAM as DUP.SYS doesn't lock up the computer or corrupt DUP.SYS.
I found a quick way to find the routine to display the menu was to write
a program to search for CMP #128 (checks if break key is pressed).
10 FOR I=10000 TO 20000:IF PEEK(I)=201 AND PEEK(I+1)=128 THEN ?I
20 NEXT I
A sure-fire way to find the address is to start disassembling around
this address; but you can probably just add 5 to the number this program
comes up with, and then convert it to hex (I'm assuming DUP.SYS hasn't
changed radically from version to version). For v4.53, the proper address,
hereafter X, is 29A5.
Next create a dummy binary file to run MyDos:
K
DUMMY.OBJ,0,0,,X

Now append DUMMY.OBJ to the file of your choice:
C
DUMMY.OBJ,FILE.OBJ/A

Further binary loads of FILE.OBJ will *RUN* MyDos after loading/executing,
assuming it hasn't been overwritten. DUMMY.OBJ may be deleted.

Source record: 112088

(in answer to a lot of messages from "phbill" and others):

COLRVIEW, the program, only loads graphics 9 or 15 files (7680 bytes). It doesn't load GIF's; your need APACVIEW to read GIF's and convert them to COLRVIEW formats. All COLRVIEW format really is, is three files, all with the same (up to 8 character) filename, with extensions of .R, .G, and .B. COLRVIEW loads all three files into memory, swaps the bytes all around as needed, sets up the display list with DLIs, and displays them. If you want to play with this, create your own files with ComputerEyes or a graphics 9 or 15 drawing program, save them as standard 7680 byte (62 SD sector) files and name them TEST.R, TEST.G, and TEST.B. Then load COLRVIEW and load up TEST to view your picture. Artist James Pittman has done just this, and create about a dozen files on CompuServe. He has also written a COLRVIEW drawing program that only works on 130XE's expanded to 256K (I have not tested this). It is available on CompuServe.

As for other formats for ColrView: my DEGASRD displays Atari ST Degas and Degas Elite picture files in ColrView. It doesn't save them to disk as .R/G/B files (these usually take up more disk space than the original Degas file), but you may view them. The latest version (1.1) allows you to "slideshow" the contents of a disk. Also, Craig S. Thom (GEnie sysop and ICD staffer) apparently wrote an Amiga ILBM(IFF) to ColrView program which he never released. Some of his results were uploaded to GEnie.

By the way, ColrView Gr.9 resolution is 80 x 192 x 4096 colors, Gr.15 resolution is 160 x 192 x 64 colors. The 6502 spends an *awful* lot of time servicing the DLIs, so much so that serial bus (disk I/O) is not possible when the ColrView screen is displayed.

Sounds like I better write an article for "Atari Classics" describing this ColrView stuff, huh? :^)

1150. Joystick/mouse control of cursors

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-06 23:50:28 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <T3N9gB5w164w@cyberden.uucp>
Source record: 112084

I was going to get a file that supposedly controls cursor control via the joystick on TextPro, and it claimed (but not named) a few other word processors. I'm wondering exactly how hard this would be, and do you think this is something that can be (I'm becoming a Mac/IBMer it sounds like!) running in the "background". (God.. I want accessories! 'd better get an ST! hehe)

I was just (well..am still) using DeTerm (I was fooling with the menus), and thought how neat it'd be to use a mouse or joystick with it. This program rivals IBM programs I've seen for windows! I want to try it with SpartaDOS (once I GET SD!) and try out the CLI to run the scroll and key-repeat things that came with DeTerm. I love having all these little tidbits I've never had before running on all this software. My only complaint is that so much of it is run without taking into mind the OTHER programs of it's size and use that they start clashing together. I understand that some of it is system stuff (when to call things, and all that), but has anyone actually made a bunch of files that are like accessories on the other "bigger" systems? (mac,st) Joystick controlled cursor sounds neat (if it controls it how I think it does). I'd like to see an IBM keyboard thingy (the upgrade) that'd work sorta like IIGSs(well, not really, but look like it I guess). The keyboard would be connected via a plug on one side, and a joystick or digital mouse would be connected on the other. Then the joystick could be configured to emulated "up", "down", "left", and "right", and [RET].. and possibly [ESC] (if it had two buttons, like Genesis controllers... or was a two-buttoned mouse). I hope my ideas are getting to someone who actually cares and would create such a peice of hardware. I'd definetly buy it (if the price was within my slim "budget".. if you could CALL it a "budget!")

Well... thanks for reading this far!
E-mail me if you have any spiffy ideas or comments!

Source record: 112098

Well, on line so a few whoops! may happen. If you want to debug from basic for now, just assemble this, BTW: have some logical operators that can be called from basic that'll do logical operators on blocks of memory. This'll work (or should) on byte or word sized operators via "ANSWER=USR(ADR,X,Y)"

```
PLA
PLA
STA $D5
PLA
STA $D4
PLA
AND $D5
STA $D5
PLA
AND $D4
STA $D4
RTS
```

It's relocatatable, just change the 'AND to whatever function you need & it can be stored in a string.

The last I heard was the author (I'm sorry, I don't know his name) was
prohibited by Atari from distributing the software because it contained
"Official" 8-bit code. Atari will only allow emulators to be distributed for
other machines by them (I.E. ST/TT).

1156. "Multi-tasking" software

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-07 03:46:26 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <4Zy9gB3w164w@cyberden.uucp>
Source record: 112089

I wonder why there's no good multitasking software (oops. should've been in quotes!) for the 8-bits except BobTerm.. and that doesn't do much compared to what I can imagine. At school, we're using Word Perfect on Apple//s, and it can sorta multitask (do a print job and edit at the same time). The reason I know for sure that it isn't the buffer is the fact that you can't "exit" the program while it's in a print job. Why can't we have a program like BobTerm unArc as we're online? This'd be esp. cool with a major upgraded system (1meg, perhaps!?)... have a buffer full, do a down/upload, and unarc something at once! (a little slow, of COURSE, but I'd live with it!) Atari 8-bits have amazing speed compared to any other 8-bits (ever see PFS:Write on the Apple//s? Ouch... is that slow!) The only thing I'm almost impressed with on an Apple for speed is it's ability to draw hi-res lines very quickly.. but we have an excuse.. we have to handle MULTIPLE mode sizes and memory set ups/colors and yet have only 1 routine. I think it's very impressive. I wouldn't mind a hi-res line routine. It'd be much faster than the all-purpose one. That's sorta my view on my entire system. You have the "all-purpose" stuff which is really awesome, but general-purpose, faster routines'd be cool. I see no need for a ton of code (menu/fanciness) on an unarcer. Hell.. why not have it unarc as it downloads!?

Oh well ... I can live with my system as-is, but right now I'm using DeTerm, and am very impressed. It looks VERY MUCH like an IBM program (for some reason I feel I must be impressed with that.. it's been subconsciously imbeded into my mind, I suppose). I love the windows and stuff. I just wish it were faster like BobTerm, and could handle BobTerm's psuedo multi-tasking.. I LOVE THAT!.. But I also love windows and pull-downs as well! Never satisfied, am I? hehe! ;)
Well.. I can't wait to here any comments on
my ideas! Thanks alot! (hmm.. for now, howabout a nice safely stored module for BobTerm... I have no modules for BobTerm!!!.. Is there a CLI module for SptaDoS for BobTerm? (I have no SD, and really want it! I'm missing out!!)
thanks in advance!

>you get a bill for the amount, which comes as a shock! We've only been allowed
>to post to the net since last September. Before that, we could read but not
>post. British Universities have to work on very tight budgets, especially here
>because we are so small. Posting onto the net is the only way I can ensure
>things get to people, without too much cost. It's also a lot easier for me.
>
>Dean Garraghty. djg0@uk.ac.aber
>

I propose rewriting the FAQ to say something like this:

How do I upload to the atari.archive?

1. If you can FTP to atari.archive, you can upload directly to the 8bit/new
directory. Please also upload a short description of your upload.

2. If you cannot FTP to atari.archive, you can uuencode your upload and
email it to the 8-bit archive moderator, jrd@stony-brook.scrc.symbolics.com.

3. If you can neither FTP to the archive nor send email, you are welcome
to post your uuencoded upload directly to comp.sys.atari.8bit.

Fair enough?

I'm still curious, though, what exactly you mean when you say "BART
just doesn't work properly" for you.

1158. MyDos: Halting DUP.SYS reload, removing GRAPHICS 0 call

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-07 04:38:17 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1992Mar7.043817.17261@magnus.acs.ohio-state.edu>
Source record: 112093

The following short program may be
ENTERed from ATARI BASIC. It modifies
the DUP.SYS file of MyDos v4.53 but
should work with older versions as
well. The program eliminates the
GRAPHICS 0 call which DUP.SYS normally
makes prior to displaying its menu.
This allows you to set your screen
colors before calling DOS. Also you can
type DOS while in a graphics mode and
use DOS in the text window.
The program also creates a 1-sector
binary load file called RUNDUP.OBJ.
RUNDUP.OBJ does what its name implies
-- it jumps to the routine which
displays the MyDos menu. When a
binary file is loaded, MyDos's DUP.SYS
is normally reloaded before returning
control to the user. If you append
this file to the binary file, DUP.SYS
will not be reloaded; instead, the
menu will be run, without loading
DUP.SYS back into RAM. To add
RUNDUP.OBJ to your favorite binary
load file, ANYFILE.OBJ, type from DOS:
C
RUNDUP.OBJ,ANYFILE.OBJ/A

where ANYFILE.OBJ is any file which
previously loaded DUP.SYS upon
exiting. NOTE: Since many binary
files overwrite DUP.SYS in RAM, this
method will produce unpredictable
results. In other words, it assumes
an uncorrupted copy of DUP.SYS still
exists in RAM after running or loading
ANYFILE.OBJ.

```

1160. MyDOS problems

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-07 10:11:09 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <aTg0gB2w164w@cyberden.uucp>
Source record: 111963

I'm having problems with a ghost 120 sectors free on MyDOS disks. Here's
the "scoop:"

I download 2 files... 1 about 17k, the other about 15k. Niether work.
I delete the 17k one (BTW: the k was freed by the deletion of a 300
sector file) and then upload another 17k file. (I had 49 sectors free,
then the extra 17k from the deleted file.. plenty of room!)
In the middle of the download, it get's aborted because the disk is
"full". I check the files and it has 120 sectors free. This has happend
many times with MyDOS. What's up? My drive is a 1050 stock, and the disk was
formatted with MyDOS's [A]-enhanced 1050 density to give 1027 sectors
free right after format.

Is this just a bug in MyDOS or what? I don't exactly like to think I hav
120 sectors free when I don't. Especially when I >should!<

Oh... my copy of MyDOS is 4.53 I believe (4.5x, at least)
Thanks for any help! Bill

Folks...

Recent postings on the net indicate that an alpha copy of Bob Puff's LZH extractor (v0.1) is in circulation.

Please note:

This is a VERY PRELIMINARY version of one of Bob's myriad projects (i.e. it has some bugs and doesn't handle all LZH variants.) Most importantly, it was never intended to be made public.

No telling where the copies circulating came from, but please. As a courtesy to the author, don't distribute this file! If you find it on a BBS, please politely notify the SYSOP that it is NOT a legitimate file.

Thanks for the bandwidth...

If you're talking about the "Expo 1991" demo, that WAS posted just a few weeks
ago, and some people have complained about posting large uuencoded files on
this group. Besides, it doesn't cost that much to download from GEnie,
and you wouldn't have to uudecode it!

There's probably some info around on RLE if you just need a simple routine. RLE was set up to do non-binary data, but something similar was used on the MicroIllustrator compression format, 'cept they added vertical compression & used 16 bit values for length of data. Anyway, you code the type of data in the 1st byte something like: IF BYTE<127 => non repeating data & you transfer it straight to destination. If BYTE>127 => repeat next byte BYTE-127 times. You then bump your counters the appropriate value in the 1st case or 2 in the 2nd. The latest one of this type i saw in Dr. Dobbs Journal ignores repeats of less then 3 & was written in 'C.

Well, I admit, I read the original post quickly. Wasn't it something along the lines of 'how do you pack this amount of levels in RAM at once?' Well, I remember BoulderDash and wasn't it somewhere around a couple dozen levels? It is rather common practice for game programmers to just redefine the font and use graphics 1 or 2 mode [if my memory is correct... multi-color low-res text mode]. This allows you to pack a whole map into an EXTREMELY SMALL amount of space. I met Philip Price once when he moved up to Lompoc, CA. He is the author of Alternate Reality and Trail of Beta Lyrae [remember Price's Priceless Picture Painter???]. I asked him how he generates the graphics for Beta Lyrae and he mentioned something about using character graphics. This was about 5 years ago so I am not sure..

Hahaha! SpinDizzy is -HUGE-! That's the one game that most [and still does] astonish me on size.. Something like 200 or 300 screen 3-dimensional map! Kind of like Marble Madness in a strategy game. I played that game for about a year until I could finish all the parts without the clock running out. Didn't they put it out on the ST?

Bill Kendrick (phbil...) asked a general question about data compression, which has led to a lot of speculation here as to how it might be done, standard algorithms used, etc. etc. However, I think most of the respondents so far have missed the point of Bill's original question.

First, sure, the techniques described so far, e.g. "compress the program to reduce its size, and prepend a little uncompresser at the beginning that loads in FIRST and decompresses the rest at load time," will work and are the idea behind such things as "self-unpacking archives" in the PC arena. However, when used for on-the-fly unpacking of load-and-run code, the end result, the total number of bytes that can be used to represent game screens, etc., is STILL limited to the amount of memory present on the system. Bill's original question/comment was, to paraphrase it rather badly, "I'm impressed that the BoulderDash game(s), e.g., can contain so many large levels without ever having to access the disk after the game first loads: how do they do that?" I.e., given a particular limit on memory, and ignoring how the contents of memory GET there, how the heck do some games cram so many different levels into, say, 48K or 64K?

I can't address the exact techniques used, but this was my interpretation of Bill's original question, for the sake of getting the answers to this particular track AS WELL AS the general prepended-unpacker thread which is interesting in its own right.

And lastly; Bill, you're impressed by BoulderDash et al; have you ever seen a British (?) game called SpinDizzy? Now THAT's a game with a HUGE number of different rooms...

Yep! What's cool, is I'm soon getting a Parrot and ComputerEyes, and will add "oh!" and "ah!" sounds to the game!! So far, it's barely started, but I have a stunning (well..stunning for BASIC...nice to look at, mainly) title screen, and the game screen's got almost all set up (no forest or outer-space backgrounds.. the entire backgrounds are made of graphics 0 characters (with a DLI to make them fade away into the background), and the blocks'll be sprites..) The game will have no music except on the title screen (unless I can find some more easy-to-use music.. right now the title uses the expo91 "POKEY" demo music.. very cool.. the title is quite impressive for TurboBASIC) I game will ONLY run on xl/xe machines (including 1200xl, otherwise >I< couldn't use it!), so the 400/800s will just need to upgrade!! (sorry, guys!) It'll probably be an ARC, but I might DiskComm it (for boot purposes mainly..), but I'll definetly ARC that, to make it smaller. I'll uuencode it and upload it to the archive when it's done (you'll all have to wait a few months!!!). If it doesn't show up there, I've done something wrong (I'll post when I upload it), and might just mail it to anyone willing to upload it for me. It'll also be uploaded to BBSs here in the SF area (BAAUG, AtariBase, ABACUS, SCCAUG) for anyone who calls these places who're on the net (at least 3 of you I've heard of). I'm rather excited, and will attempt to make it as much like the arcade (well.. Lynx) version. I'm going to borrow the instructions for the Lynx version from a friend who first showed me this game (I was VERY impressed.. esp. with the sound... WHY IS GAMEBOY STILL AROUND!?)

Well.... I suppose I'll work on it a little today, as it's the weekend. I hope to actually FINISH this project (unlike Plaxtriss... I loaded that up the other day and couldn't beleive I made such a pathetic program... DLI's RULE!! I only had 1, and it wasn't even mulitple!)

Thanks for being interested! cyal8r! Bill

1169. 8bit system for sale!

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-08 00:10:07 UTC
From: zeibari@wharton.upenn.edu
Message-ID: <1992Mar7.191007.1@wharton.upenn.edu>
Source record: 112095

Hello 8bit users,

I would like to sell my 8bit system.
The following items are for sale as a
whole system only!

ATARI 130XE, orig. price: $160.
excellent condition, used for about 6 months, then I bought
my ST. Comes with manual.

NEC Color Monitor, orig. price: $250.
It's an NEC, the best made monitors, if you use a TV with your
computer, your missing out! Comes with cable to connect to
computer. Has Internal speaker AND VIDEO & AUDIO OUTPUT!!!

INDUS GT, orig. price: $320.
comes with manuals and disks. Sometimes has trouble reading
disks. Flaky.

ICD P:R: Connection, orig. price: $90.
comes with manual, disk and special printer cable.
NOT sure if this works.

Synapse SYNFILE+ and other original games and demos!
And ATARI graphics & game design book!

Here is your chance to purchase a computer you can't find anywhere else.
I am asking $450 obo. I think its a fair price but I'm flexible.
I am accepting offers until Friday the 13th. I will sell the system to
the person who offers the best price. I will pay shipping.
Please don't let this sit in my closet anymore. Get up and make an offer!

Greg Zeibari.

1170. Re: "Multi-tasking" software

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-08 02:57:13 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92067.215713JJMCWILL@MTUS5.BITNET>
Source record: 112097

In response to BIll's questions regarding Multitasking, There was once such a program, called MTOS. I purchased a version of this ages ago, I think 1986 or so. You could Multitask BASIC programs and some ML, but it was very limited as to how large your programs could be, and other stuff as well. It didn't work very well, even BASIC multitasking was so-so, which I guess is why it didn't really take off as an 8 bit product. I really don't see too much need for multitasking on the 8 bit atari. It was never meant to do that, and you need memory management and relocatable code to really do it properly. These are two things the 6502 can't do extremely well. With the expanded instruction set of the 65816, relocatability at least becomes highly feasible, and Dataque's Turbo-OS which comes with his Turbo816 card has some rudimentary memory management routines built-in. Still, I would much rather prefer some task switching as opposed to multitasking. I don't need to dearc while downloading. If you want to dearc a file while online, you can quit Bobterm, run UNARC, and then return to Bobterm and you will still be online. DeARCING is meant to be an offline process in my opinion. There is a task switching program as well, but only the most behaved programs seem to work with it. I don't currently use it, as I am Sparta X user, where the words "well behaved" just don't seem to apply to most of it's internals. With a RAMDISK, task switching is almost achieved. When I was running my system with a 9 pin printer, jumping back and forth between Daisy Dot III and Textpro was almost instantaneous, especially when the document was kept in Bank 1 or 2, as they were always there, even when you left the word processing program. The only thing that could have topped it was a program to just tell DDIII to look into Textpro's buffer space for the code, instead of loading it off of the RAMDISK.

Just my ramblings.

Source record: 111968

It is possibal, you need an interface, and you would have to figgure out the codes. Basicly the controller would be a joystick port, configured to recive, in the same fassin as a light pen, but instead of a lightpen you would have the remote. You would hae to provide your own software. As for controlling things via IR you need to simple hook a transmiter up. Ask a local hardware grue to cook things up. And always timeing is critacal. Eiter turn ANTIC off, or make sure i will not try a read while you are tryig to time the IR signals.

>

I tried e-mail, but my site doesn't know where status.gen.nz is.

Jon, instead of bopping in here occasionally to remind us that you're in New Zealand and you work for Z*Net, why don't you help us get Z*Magazine in regular distribution here on the Internet? Frank Seipel has been spending his own money to download the mag from CIS or GEnie and then upload it to the archive since this past fall. Do you not have access to your own publication? Can't you upload the mag to the archive for us?

Also, as has been stated in the FAQ for a while now, there used to be a mail-list for distributing Z*Mag on the Internet run by Greg Lindahl. I happen to think it's important to get a mail-list going again. This would be more convenient for most people than getting it from the archive. But no mail-list can be run by anybody without the mag to distribute in the first place. I don't know what Greg's deal is lately, but he hasn't been answering people's email on the subject, despite at first saying he would be happy to distribute Z*Mag again if only someone would supply him with it. He's at gl8f@fermi.clas.virginia.edu, or zmagazine-request@virginia.edu. Is there anyone else out there that knows how to create a mail-list?

Basically, I'm frustrated that we still don't have a "permanent" source for the mag on the Internet, we still don't have a mail-list, and Jon Clarke, who's listed on the Z*Mag flagstaff, has yet to show any interest in any of this.

So you know that my goal is not just to gain access to Z*Mag, I'm very interested in doing a "Persuing the Internet" type of column for Z*Mag.

But I'm not going to do such a thing until I know I can GET the mag in the
first place.

The best answer I can give to your question is that Atari and all of the other commercial software companies really don't care about the Atari 8-bit anymore. However, this brings up a question as to what will happen to the few companies (3rd party) that continue to sell software for the 8-bit. Obviously they won't be around long if users pirate software that these few companies are trying to sell.

Then there's the flip side: If you can't find it anywhere, what should you do? Go without? Get a cracked copy?

My opinion: If you REALLY want to but it, exhaust ALL options in trying to find it! If you can't find it to buy it and you really need or want the program,get it however you can, moreso if you have a few thousand invested in you 8-bit setup. Why should your investment suffer just because you cannot find a program that you KNOW that your MORE than willing to buy?

Bill,

Hey, is there a distinct advantage to going to ZIP files , rather than staying with ARC? I am just curious about the two different formats, and if you get better compression from one as compared to the other. I think It is great you are doing this!!

I found 2 things today. 1 was in TurboBASIC. When you LIST, you can slow the listing down by holding any of the 3 console keys. I don't remember this ever being talked about in the instructions. The other was a funny thing about DeTerm. When you're in "SELECT" mode, with the pulldown menu bar at the top, you can press the letter that each selections starts with (R for "R:Dev" for example) and get that menu. From there, you can press the letter of one of the menu selections (B for "Baud" in the "R:Dev" menu). I don't remember ever reading THIS either. I may have over looked it, as I've only just started using this program a lot, but I'm sure I would've remembered. I think I may just go back and check the instructions, tho. Also, have you ever noticed that when you pull down a menu, then select a menu selection, the menu dissapears and THEN the window or whatever pops up in the center of the screen. I found that this isn't true in only >1< case. When you're in the "Disk" section, if you press a number between 1 and 9, it will pop up a window with "Dx:*.*" (x being whatever # you pushed) and "please enter directory mask". THis is partially covering the "Disk" menu, and when it dissapears, the menu STILL stays on the screen behind the file-listing window (directory scroller). I was wondering why it wasn't done like this in ALL window cases. If the program has the spare 1k for this buffer, why not for anything else. Was >THIS< documented!??

Also, does anyone have a VERY detailed instruction manual for TurboBASICXL? I started work on one, but I don't think I ever finished.

Bill Kendrick

remember: the more buttons you push, the more chances you have of getting something done!

>worth $50!! (well... maybe $30, but I didn't know where else to get it
>at the time.. I bought my modem along with it back in Sept/Oct last
>year).... Is this not PIRACY!? Why the hell is Atari letting this
>happen, when they won't even let us PURCHASE the rights to their 8-bits!?
> This really sucks... I'm VERY mad!!
>Comments?

I can understand. I saw it in the stores for $50 for a *long* time. I
never bought it until I saw a new copy in a clearance bin (when a Sacramento
distributor was eliminating their Atari 8-bit stock) for $5. Believe me
I grabbed it quick!

We should all be getting used to this crap by now though. Since support
fell out from under me and my 800XL (vintage, early 80's -- about 10 years
old now!), I have sworn never to purchase Atari equipment again. Why? I
can see the same thing happening to the ST line if the TT's ever become the
happpenin' thing. Atari simply doesn't know how to advertise their machines.

A friend of mine is a die-hard Atarian and lauds his 1040STe. Well, maybe
that's because he owned a C64 (ouch :-), and didn't have to put up with the
Atari 8-bit fiasco.

Maybe that bit about Atariwriter+ means that the rumors about making 8-bit
software public domain have some foundation.

The issue seems a little different when atari allows its
own software on its own BBS. seems to me that if I were
trying to sell said program, I'd be upset with atari for
allowing it to be on the BBS. Since atari is allowing
it, I don't think it would be considered piracy.

The Michtron base numbers are:
(408) 745-2191
3
4
5
The numbers will be gone as soon as the new net board is fully implemented. (although a lot of people are pleading otherwise!) The net seems to be 90% there, the only thing is all the files from the Michtron BBS haven't been transfered yet. The 'HOME' number will be (408)745-2196, but you will be able to call ANY Forem ST BBS (about 50 scattered accross the US & I think it's international too) & the message will get to Atari. Bob Brodie has (director of corp communications or something to that effect) been answering all queries passed his way.

>on memory, and ignoring how the contents of memory GET there, how the heck
>do some games cram so many different levels into, say, 48K or 64K?

Well, it's actually pretty easy. Boulderdash, for example, saves a map
as an array of numbers, one for each "block" on the screen. Each number
represents the type of thing thats in a block. A zero, for example, means
dirt. 2 means grass. 3 means a wall. And so on. When the program draws
the map onto the screen, it simply inserts the proper graphics for each
"square". This allows you to fit a 32 by 32 map (which is a bit larger
than Boulderdash's, actually) into only 1K of memory, so it's easy to
include all of the levels into the executable, and not have to load any
more from the disk.

Or, you can compute the level dynamically. When I did GATEWAY TO APSHAI,
I built each level using a random number generator which was "preset" to
a different "seed" number for each level. Since a random number generator
will *always* produce the same output if you start it from the same "seed",
you can get a repeatable series, but by changing the "seed", you can get
entirely different series. I then used the output of the generator to
construct the maze, drawing it onto the screen with character graphics.
GATEWAY only had 128 different levels in it's 16K cartridge, although there
was the possibility of 65,536 different levels. We decided that'd be
a bit much, though :-)

Mike Farren - no longer employed by Commodore. Still only my opinions,
and not those of any organization.

Well, I have a basic program that will allow MYDOS to run in
US-Doubler format. (Well, it was originally for DOS 2.0, but it didn't
have a problem with my MyDOS double density disk.)

I'll try to get it on the archive tomorrow (March 10). If those
people that sent me mail asking for it can't get it from the archive,
I'll uuencode it and send it to whoever asks.

Later.......

PKZip is faster and give MUCH better compression. ARJ gives even better compression and the next version is rumored to be even faster than PKZip. LHArc is painfully slow and the LZH files it generates are relatively large, but on the other hand, the source code is free to anyone who wants it and is quite portable.

1195. AtariWriter+ UPLOADED!?

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-09 23:08:05 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <700209274.F00001@tdkt.kksys.com>
Source record: 111995

To go along with Atari, there are MANY others that consider the Atari 8-bit line of software PD at this point. The trouble is that it seems impossible to get a complete list of what is or isn't. One program I know of for a fact is Ballblazer. I tried to get a copy from Epyx after my suffered burnout from a power surge into my 1050 back in '89. I called them on the phone to find out what kind of arrangements I would need to make to get another copy, and they told me that all I would have to do is call around to some l/d Atari boards and would most likely file it online. I told them that I PREFERED to buy it. Their response was that they didn't carry anymoreAtari 8-bit products except for about 35 copies of Boulderdash Construction set, and they gave me that for $5.00 ^(shipping was 3.50 so I paid $1.50 for the disk in the ORIGINAL UNOPENED package!)^. In inquiring about their other products, the response was the same.
I still say, if it can be bought and you know it's on the market, BUY IT!! It's the ONLY way left to show the few companies that remain that we as Atari 8-bit users are willing to support them. If it can't be purchased, look around for it, including inquiring through user groups. I feel that in no way if your investment in the Atari 8-bit needs a certain program and you've **HONESTLY** made a effort to purchase the product and cannot find it, get it however you can.

1197. Re: AND OR NOT in Basic

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-10 02:37:20 UTC
From: jwd@en.ecn.purdue.edu
Message-ID: <1992Mar10.023720.27410@en.ecn.purdue.edu>
Source record: 111990

In article <1992Mar8.175519.440@umesve.maine.edu> deej@thrush.umesve.maine.edu (Dj Merrill) asks for assembler routines callable from BASIC which will do bit-wise ANDs, ORs, and NOTs.

In article <1992Mar5.183712.19505@watserv1.waterloo.edu> mmmmei@norton.waterloo.edu (mm mei) expresses a need for bitwise ANDs and ORs as well as other low-level stuff.

In article <55465@cup.portal.com> Rick_Michael_Cortese@cup.portal.com provides assembly code which will do ANDs, ORAs, XORs, LSRs, ROLs, and RORs.

Rick's solution is good and fast.

Here is the documentation to an admittedly less-efficient BASIC routine which will do ANDs, ORs, and XORs. The reason BOOL turns-out to be less efficient is because in order to use it, BASIC will have to perform three ADR()s, one LEN(), and one ASC() before actually calling the machine language subroutine. The text is from the file BOOL.DOC which, along with BOOL.DEM, may be found in the file util07b.arc at the atari.archive.umich.edu ftp site. (BTW: To NOT an 8 bit value, XOR it with $FF hex or 255 decimal.)

```
* * * * * * * * * * * * * * * * * * * * * * * * * * * * *
BOOL

BOOL is a BASIC subroutine to perform boolean logic on two strings. It
supports "AND", "OR" and "EXCLUSIVE OR".

IMPORTANT NOTES

1. BOOL is fully self-relocatable, so it may be moved anywhere in memory.
2. The result is stored back into the first string.

CALLING

RETURNCODE=USR(BOOL, OPCODE, S1ADR, S2ADR, SLEN)

BOOL: The address of the BOOL subroutine [usually ADR(BOOLSTRING$)].
OPCODE: Decimal value of the operation code, like ASC("A") ["A" = AND; "O" =
OR; "E" = EXCLUSIVE OR].
S1ADR: Address of the first (and the result) string [usually
ADR(DATASTRING1$)].
S2ADR: Address of the second string [usually ADR(DATASTRING2$)].
SLEN: Length of the strings [usually LEN(DATASTRING1$) or
LEN(DATASTRING2$)].

RETURN CODES
```

0 Normal completion
1 Error: wrong number of arguments.
2 Error: invalid operation code.

DEMONSTRATION

BOOL.DEM is a simple tokenized BASIC (binary) program which will demonstrate the BOOL subroutine. First it shows how to use BOOL to shift upper case to lower case. Then it shows how to use BOOL to swap two strings WITHOUT using a third string. Finally it allows you to test the boolean logic by typing in bit strings of 0's and 1's.

USE

To use the subroutine, just transfer the statements 900-904 to your own program (you could do a LIST "D:TEMP",900,904 from the demo followed by an ENTER "D:TEMP" into your own program); of course, you can renumber the statements as necessary. Remember to call the subroutine once at the beginning of your program to set it up.

1198. 8bit system for sale, name your price.

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-10 04:54:05 UTC
From: zeibari@wharton.upenn.edu
Message-ID: <1992Mar9.235405.1@wharton.upenn.edu>
Source record: 111993

Hello 8bit users,

I would like to sell my 8bit system.
The following items are for sale as a
whole system only.

ATARI 130XE, orig. price: $160.
excellent condition, used for about 6 months, then I bought
my ST. Comes with manual.

NEC Color Monitor, orig. price: $250.
It's an NEC, the best made monitors, if you use a TV with your
computer, your missing out! Comes with cable to connect to
computer. Has Internal speaker AND VIDEO & AUDIO OUTPUT!!!

INDUS GT, orig. price: $320.
comes with manuals and disks. Sometimes has trouble reading
disks.

ICD P:R: Connection, orig. price: $90.
comes with manual, disk and special printer cable.
NOT sure if this works.

Synapse SYNFILE+ and other original games and demos!
And ATARI graphics & game design book!

Here is your chance to purchase a computer you can't find anywhere else.
Okay, make me an offer, I want to sell it to a person who knows
what they're doing with ATARI 8bit computers. That is why I'm not
selling it thru the paper.
I am accepting offers until Friday the 13th. I will sell the system to
the person who offers the best price. I WILL PAY SHIPPING.
Please don't let this sit in my closet anymore. Get up and make an offer!

Greg Zeibari.

1199. sio2pc v3.03 on archive

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-10 05:03:58 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.700203838@vincent1.iastate.edu>
Source record: 111992

I have put version 3.03 of sio2pc in the 8bit/new directory of atari.archive.umich.edu, in the file sio2pc30.zip. The files are in IBM format. I received this version from Nick Kennedy today (3/9/92). The files for building the interface were not included on the disk from Nick, so I included those from the previous version.

For those who are unfamiliar with sio2pc, it is an interface that you can build for about $20-$30, which lets you use your IBM PC to emulate an atari disk drive. The atari files are stored in a pc file on the hard disk. This version allows any size for the atari image file on the pc, and is supposed to use spartados ultra speed io, although I haven't tried it. If you are upgrading from a previous version, make sure you read the rev3_0x.doc files.

I am currently working (slowly) on a replacement for the makadisk program included with sio2pc. It will greatly simplify transferring files to and from the sio2pc image files. I will post again when I get this finished up.

> can see the same thing happening to the ST line if the TT's ever become the
> happpenin' thing.

Bad comparison. The TT and the ST are fundamentally alike, where the ST
and the 400/800/etc. had very little in common other than the chip
manufacturer. The TT basically is just an upgraded ST with a faster CPU,
more ports, more video modes, and a better memory manager. The ST replaced
the 8-bit line. The TT is not a replacement, but rather an enhancement. As
a longtime ST owner (six and a half years), I don't see the TT as a threat.

1201. DEMOs - Illegal or not?

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-10 08:38:26 UTC
From: /PN=COLIN.W.HUNT/O=SPRINTINTL/ADMD=TMAILUK/C=GB/@SPRINT.COM
Message-ID: <"CGJC-1634-6886.17"*@sprint.com>
Source record: 111996

The April issue of Atari ST User has just arrived and theres an interesting little news item about the South West Software Library (SWSL).

It appears they have recently been raided and have had all there demo disks removed. Apparently, the BPI (British Phonographic Industry) watchdog has been in contact with Federation Against Software Theft (FAST), and there has been a meeting to discuss music demos and copyright implications.

Tim Dabin stated 'We can't make any distinction between this and any other piracy medium. The fact that it's on a floppy disk is irrelevent - reproducing copyrighted material without permission is an offence. We are now comparing PD disks with the original work in order to establish whether it's the same recording'

Now my comments:
The fact that FAST have moved against PD libraries with demo disks containing samples of records has not surprised me and should be taken seriously. There is now a bit (potential) question mark over all slide show picture disks with digitized pictures from films etc and MIDI files containing current copyrighted recordings.

I don't know what the relevent laws outside the UK say, but anyone selling PD software within the UK with any of the above material is open to either civil or criminal proceedings.

I want pretend that we (the BaPAUG) are 'clean'. We don't have any music demos within our PD library, but I'm sure that some of the MIDI files may be illegal. Because of this we are going to re-evaluate all the disks within our library and withdraw any that have that potential question mark over them.

Good luck! Sounds like a great idea. There are SO MANY possibilities for SIO2PC. For example, why not write a simple program that would let you completely control your PC from the Atari?

1205. How do I get cc65 from atari.archive working?

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-10 17:23:04 UTC
From: mmmei@norton.waterloo.edu
Message-ID: <1992Mar10.172304.16245@watserv1.waterloo.edu>
Source record: 111999

Hello again,

I corresponded with the creator of cc65 on the atari.archive. He
worked on it about 3 years ago and is not terribly familiar with it now.

Does anybody out there use cc65? What is your system hardware and
software? Do you binary load and then run at a particular address
(like $2800). I noticed the source code for the compiler on the archive
as well. I would download and use it but what do I compile it with?
...Obvious checken and egg problem. The source obviously helps give
insights into how the compiler works but modifications and extensions
require it to be re-compiled.

I just need to do a small bit of simple C code. I could do it in Atari
Basic but it would be sinfully slow. I would purchase a C compiler but
it would be hard to find, I probably would get little if any support for
it, etc.

Thanks in advance

Just a quicker note <grin>. I think you must of had a typo in your response, I think you meant 10's of Forem bases, NOT 100's. Look, I don't mind being corrected as long as the correction is correct. You seem to be trying to make me look way off base by over stating the number of net boards. Bob Brodie says "over 70" and a letter that was posted on Full Moon, Steve Riders Forem ST support BBS, list a total of 78 boards. Included in this is a private & as such I think that safely reduces the number to less then 100. On the bright side, I think you have a promising career developing. Jack Tramiel probably already has an eye on you for reporting ST sales. If you now of 100's of Forem NET BBS's, just add the names to the list. It will be much more constructive then just saying someone is wrong.

Nope. You are looking at the nodes registered to receive 1 crossnet base. I know that when I ran FoReM I didn't get that base.. its not required. Also, there is another program.. Turbo Board, which is a clone of FoReM, so there are more boards on that also, but they are basicially the same thing.

FoReM is one thing.. Crossnet is another. You can run FoReM fine, and not Crossnet.

how do I know this? I ran FoReM for a year or so, before switching.. (I switch programs every year or two it seems..)

Message-ID: <1992Mar11.043710.25671@caedm.byu.edu>
Source record: 112004

I have been needing a program that writes atari disks on the IBM. I downloaded Atario, but that only reads Atari disks. Now I have heard of Util.exe, but I have heard about bugs in it. Does anyone know the author of this program? Is the source available? I would be very interested in taking this source and modifying it, maintaining it, etc., if it were written in Pascal (shudder) or C. I thought about modifying Atario, but there are lots of bios calls and interrupts that I do not understand. I know a lot about the Atari, but not about the IBM. Even if someone told me how to read/write Atari 256 byte sectors on the IBM, I could write my own program from scratch. Please reply via email if you have any relevant information. Thanks.

Eric Sokolowsky (esok@bones.caedm.byu.edu)

1210. ACTION! runtime needed

Newsgroup: comp.sys.atari.8bit

Source record: 112006

Hi folks. I just ordered a used version of ACTION! from somebody, and also am having Innovative Concepts send my the programmers' Toolkit. For anyone else who uses Action, I suggest ordering the toolkit while they are still available for $24.00 from Innovative Concepts. It is more expensive than the $14.00 ICD was asking, but then again ICD just shipped the last ten copies to Europe. Anyway, I will be needing the public domain runtime modules. If anyone has these, and any other ACTION utilities, sample programs, etc. Please let me know if you would be willing to mail them to me. I would be glad to cover cost of postage and diskette.

Cheers,

Jeff McWilliams

1211. Atari File Server

I've just uploaded my latest creation, the Atari File Server, to
the atari.archive. This program is similar to sio2pc, but it doesn't
use diskimages. Instead the Atari writes/reads directly to/from the
the PC-harddisk. This makes it more easy to test new programs etc
without putting them into/out of diskimages.

Documentation and a configured copy of MyDos are included in the archive.
Users should remember that this program has just been released, ie
there might be buggs! Some difficulties are mentioned in the
document, but others might come up, so please feel free to e-mail
me. I've tested the program with my 130XE and PC-AT, but as I haven't
got a disk-drive I'm not sure how this works out...

Yes, the word from comp.sys.atari.st, from Weiner, is that the atari.archive
seems to be safe for now. The University of Michigan ended up firing the
person that was in charge of all the archives (MSDOS, MAC, Atari), but since
those running atari.archive were already doing it on a volunteer basis
they won't be affected. He said the Mac and MSDOS archives would probably
have to be moved to various other machines at umich, but that atari.achive
is probably small enough that it will remain on terminator. So we can all
breathe a sigh of relief, since we really did almost lose our archive.

Yes, I'll try to explain what I know about it. When Frank uploads them
they seem to end up with a "hard" CR at the end of each line. When I FTP
it to my VAX account, before it got arc'd on the archive, there's no problem
yet. But then I FTP it to the Free-Net for posting to the Atari SIG there,
and it comes out such that it prints every line, then immediately erases
it - useless. So in between those FTP's I transfer it to my UNIX account
where I do a seach-and-replace of these invisible CR characters to get rid
of them, THEN transfer it to Free-Net, and it comes out OK.

So to actually answer your question, Z*Mag in readable ASCII form is available
on the Free-Net Atari SIG.

Frank, I don't know where these "bad" CR characters come from, but is there
any chance you could remove them before uploading to the archive?

Actually to all interested: I have released a program called COLRDUMP.BXE that prints the Colrview RGB pictures to a 24 pin Epson compatible color printer. The images are 1/2 page in size and seem to have reasonable color. Its not perfect, but it works. Once I finally get the algorythm to shift the color info from additive to subtractive values properly, the color will be much better.
Colrdump.arc is available on GEnie in the Atari 8 file area and also at JACS BBS at (609) 346-1224 in the 8 bit utilities room.
My GEnie address is R.ELY1.
The program uses 16 redefined downloadable characters in porportional mode. It requires a 130XE or 128k XL to run. It was written in BASIC XE and has been tested with SpartaDOS 3.2d and SDX. I'm sure it will work fine under Atari DOS 2.0s, 2.5, DOS XE and more than likely MyDOS. I didn't do anything strange so, there shouldn't be any problems.
One note: The file posted on GEnie has a very minor bug. There is a semi colon on line 250 that doesn't belong. The line should read as follows:
250 ?#n;TEXT$:... the semicolon was inadvertantly placed after thta statement. Just remove it and all is well. I don't have the listing in front of me, so the info is aproximate. It should look like that rather than ?#1;text$;:text$="". The corrected version is on the JACS BBS. Have fun!

This sounds great! Just for everyone's info, though - SIO2PC version 3.0 also has the ability to write directly to the PC-harddisk.

I have never had any problems using util.exe that weren't my fault.

It works great. I download to an IBM at 9600 baud then UTIL the files
onto a 5.25" from the hard drive, then take it home and use the Atari.

What sort of problems are people having with UTIL???

Jody Lenn

Hello everyone,

A few questions:

1. Is there anyone out there who has the short lived ZIP file from
atari archive ? I ftped it, but I messed up somewhere and it is
corrupted. If there is someone who has it and could arrange to
get it to me somehow please respond.

2. I'm interested in any ATR8000 stories people have about what
kind of peripherals/setups they had and used. Is the ATR 8000
capable of hadling high density disks ?

3. If anyone out there remembers the HM translator from ANALOG,
I made a modification of this to create a copy of Atari's
Operating System Revision A. So I know have a translator that
allows me to run games and things that would only run under
OS rev A. If anyone is interested, I could remake the basic
program or something so that someone could make a copy ...

Well, thanks,

> I have heard about bugs in it. Does anyone know the author of this program?

The author is Charles Marslett, whose name looks familiar to me: isn't he
the original author of MyDOS as well?

> Is the source available? I would be very interested in taking this source
> and modifying it, maintaining it, etc., if it were written in Pascal (shudder
)
> or C.

Yes, I downloaded the source from Bob Puff's "Computer World Jr." BBS
(716-247-8355) a year or two ago, although I don't recall the filename
there. You'd have to search...

I'm surprised this hasn't made it to the Umich archive yet (has it?).
I can't FTP from Portal, and it'd take a long-distance call to my old
University to even ATTEMPT to send it to the archive, so I'd prefer to
have somebody ELSE do it (wouldn't we all?!), but if demand is horren-
dous and pitiful I may be moved to do it...

The mainline of the program is in C, named "util.c". The supporting
"Atari I/O package" routines are in are in -- cringe -- ASSEMBLY, named,
ironically, "atario.asm".

> I thought about modifying Atario, but there are lots of bios calls
> and interrupts that I do not understand.

I had exactly the same experience when I looked at atario.asm.

> I know a lot about the Atari, but
> not about the IBM. Even if someone told me how to read/write Atari 256
> byte sectors on the IBM, I could write my own program from scratch.

Do you mean to say you COULD write your own program, or you could NOT?
The first and second sentences seem to contradict each other...

> Please reply via email if you have any relevant information. Thanks.

Done. Also posting to the Net because I think this topic is of suffici-
ent general interest.

OK! I'm going to have to stop using that expression though. I keep waiting for someone else to respond, but I guess everyone is busy with their own projects. Sorry to anyone I've promised other stuff to, I am working on it <g>. I'll send you a series of routines that will EOR, AND, & OR two blocks of memory incuding screen memory. I seem to recall that these are byte aligned so if you want to do 'soft' PM graphics on a gr. 15 screen, they'll move at least 4 pixels/step. I'll see it I can find the assembler code, it's got'ta be here somewhere. It's not real friendly, but it's quick & bullet proof if you take the time to figure out how it works.

1222. Re: ACTION! runtime needed

I've got the PD runtime, it includes a couple of examples of coding in Action! like a font editor & reversi game. If you didn't get the manual, I have a disgusting looking extra one available. Everyone HATES the manual, but once you start programming in Action! or if you've had a class in 'C or Pascal it become so intuitive after a month or so you could probably write a better manual. Any code I have is yours. Unfortunately much of my stuff was lost on a 720k disk crash, but there's still buggy programs that will convert a gr. 15 screen (if it doesn't have to much detail) into a Gr. 12/13 font & screen map, a good demo (similar to the manual) for a data base program that will also search for key word. Most of my stuff was for my own needs so it isn't trapped 'cause I know how to use it. Not very many comments either! I'll respond to the VBI question a few days back in Action! so you can get an idea of just how flexible the thing is. I've never been happier then in the Action! envirionment.
BTW: Bob Wooley came to the BAUGG meeting with a handful of your mail in campain stuff. He's more then fully supporting it, sorta aggressively.
I just got my copy of AIM & it's kind'a funny, but a lot of the stuff is 8-bit including long time frat members like Dave Plotkin. My bet is the 8-bit mag if it gets going will have more hands on stuff submitted for publication then any ST publication. You old enough to remember the change Compute Mag went through when they changed from type in to review format? Looks like we'll see the same for AIM if 8-bit is split off.

I know people will come out of the woodwork to shootme down on this, but....
It's been my experience that before BASIC does a USR(etc) it saves everything
in needs to know about the FP area so you can use the entire area if your
routine is called via the USR => $D2-$FF? I seem to recall one or two no-no's
like changing the values at INBUFF or something, but for the most part they
are non-coruptable. Use anything from $CB to $FF and let us know if it bombs.
I think you'll be supprised. If you need more then 52 bytes of page zero, I
think you may be using the wrong processor<g>. Constraints are it must be
via the USR =>no interupt stuff & it must finish everything before it returns
to BASIC or BASIC will overwrite it immediately! If anyone wants to
challenge me on this one, put up your code that doesn't work & I'll take a
peek at it.

Unix/DOS source to zip/unzip is available on better FTP archives, but good
luck - I think the decompression algorithms probably would be extremely
difficult to implement on an 8-bit machine with <64K of RAM.

>Can I use the remainder of precious page 0?

If FR0 is free, it is logical to assume FR1 will be free, and perhaps
the other (FR2? FRE?) Floating-point Register(s).

A disclaimer:

It is conceivable that the entire float space should be free (certainaly
no normal interrupt handler uses them.) But it is also conceivable that
some temporary space used only durring an FP call could be used by
another routine that uses the space only durring its call (since both
would control the space and neither expects to find anything there, both
would be safe.) (This is something to look for in you Mapping or any
other resource available.)

1235. Re: Chris Chiesa's Questions (was Re: DeTerm)

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-13 03:24:29 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <iZ2JHB1w164w@cyberden.uucp>
Source record: 112028

Hi all.. I see there are a lot of new messages. (for some reason I haven't got ANY mail in a week.. very little on c.s.a.8, and now 13 e-mails, and 46 new on c.s.a.8!..interesting)

Now.. let me answer a few of Chris's questions. (BTW: I >did< know about the [L]oad from "E:"ditor in DOS2.5/MyDOS.. it just totally left me! .. I'm losing my mind!)

1. I got Bob Puff's UnLZH version 0.1 (or UnLZARC 0.1.. I forget) from I beleive BAAUG BBS here in the SF bay area. Perhap's it was ABACUS BBS.. anyhow... it was just uploaded in late February, tho the file # somehow got all the way down to 2..?? I'll remember to mail the person who uploaded it and ask where (s)he got it, as well as running the thing to find out it's release/creation date. I 'te tested it, because there so far no LZH'd stuff for 8-bits. (sorry.. line noise?) (call waiting??) Umm.. As for what Font 4 is (as well as 1,2,3 and 3.1).. there are BASIC Font Editors. The 1st one stunk completely. The 2nd one was a good attempt, and versions 3 and 3.1 are fairly good. The reason I number it like this is: when I make a version from scratch, I add 1 to it. If I edit the version after a while of use (this was befor I got a modem), I add 0.1 to it, so I/you can tell that it's much like the previous ?.x version, but (hopefully) better. So far, 3.1 can do inverse, flip, mirror, 90' rotate, and normal drops (normal for copy... also good for animation.. make "!" 1 step, copy it to """, edit it, copy THAT to "#", edit IT.. etc.etc.) It can only handle 2 character sets at a time (multiple chsets make for very good animation.. used aLOT)

Ok.. for standard font file, there is one. Just save the 1024 bytes of info for the 128 characters. Remember that the CHR$ of a character is NOT the same as 1/8 it's relative position to the start of a character set. .. rather, a PEEK of a character (making space 0, ! 1, " 2, etc.. instead of 32, 33, 34..) does it.

In FONT 4, 1) it'll be in turboBASIC (easier calling of ML routines used in the previous versions.. heck.. some versions didn't even USE ML!!.. very hideously slow!) It'll hopefully be switchable into IRG mode. I might even make it like UltraFont for the c=64's, with the scrolling large editing section and the small normal sized set at the bottom.

As for Klix.. as I've posted, I got the instruction manual, and will hopefully start the dirty-work this weekend.. (this is also in TurboBASIC.. I >DO< need a "many-sprite" routine... somebody? ANYbody!? It must'Ve been published somewhere! It's not THAT hard, is it? (well.. it is for ME!.. Mr.BASIC!)

Chris, I did try the ^I thing.. and look it worked! (hehe :->)

Well. I guess that about answers all of Chris's questions and comments.. And Chris, you'll be the first to get a copy of Klix! (be patient, my son... the knowledge will come... ooh.. sorry.. beginning to sound like Star Wars/Trek!)

BTW!: Going to see if I can add "PINTS WAVE", "DIAGONAL WAVE", "OOH" and "AAH" and all that Jazz into Klix! (getting Parrot (soon, I hope!))
adios!

Ya said BASIC can't do bit operations? True.. but TurboBAsic can.
BTW: I'm ATTEMPTING work on a TurboBASIC (eww!) unZIPPER.. are there any unzippers out there!?

>
>
> Jeff McWilliams

"Beat-It" flickers vertically on the "POKEY" part, and the bottom horizontal scroller.. and horizontally on the "M" scroller. (very cool peice of code that was! Perhaps it was a coulpe of sprites and a big multiple DLI?) Also, the part that literally flickers (on and off that is) is the "monster" demo. This is just some slow page flipping routine. You can notice that it only uses 5 colors: black, grey, white, yellow, green. The only colors that arw switched are yellow-green. If it were to be done more effectively, the grey/white would be medium/brightest of green & yellow.. but that'd slow it down too much.

>
> Jeff McWilliams

I think it was just the Joust was stuck & dusty? Or something didn't close when I removed BASIC. I still don't understand that brown screen that needs to be [RESET] when you have no carts. in mine.. Oh well.. I just hold [RESET] when I power up. Sometimes I don't need too, but I'm usually watching TV as I boot.

Speaking of TV.. Here's something. Shadows. Do monitors (color ones, that is) remove shadows? Here's an example. I made a screen with two sprites and a blue screen (as well as other things, but this is the worst case on this screen.. (BTW: this is the Klix title)). One sprite was a filled-circle shape in bright yellow. (POKEd to 30) The other was green and got rid of the jaggedness (it could've been medium yellow, but I tried green... yellow+blue.. and it worked a little better). On the right side of the sprite, the blue is VERY dark, and also it looks a little redish, while the left side looks a little bluish. On AtariBase or somewhere, we discussed Amiga montiors for a week or 2. The person who had it hooked up said that it removed the artifacting effect of 80col/320 mode while still keeping color (ie. blue text, rather than blue and purplish text) I'm wondering if this type of monitor (it was a 1080 I beleive) will remove this shadow effect that I can even see on my cursor in normal colors on a gr.0 screen?? Anyone on this net have one hooked up? What are the results?? Far better, or just better 320?

Chris, I think you said that the program would uncompress itself into memory? That's NOT what I meant! I meant it would uncompress >1< level into memory, keeping all the others, including a copy of itself, compressed. Then when you advance to the next level, the program would overwrite the "level" area by uncompressing the next level. Also, I do realize that Boulderdash IS in a psuedo-graphics 2 mode (IRG, but the "blocks" (player, enemy, object, etc) are in gr.2-20x12-'ish mode) Also, Boulderd. could just say "here's dirt, now put these here" or even "put these >patterns< here". I noticed a sameness with the "enemy" maps on Zybex. Many clusters that all look the same. Also, I think in some modes, the "character-set" (if one is used).. (the enemy-shapes, I guess) are changed. ie. spinning bubbly things become fork-like things.. (very BAD descriptions.. I'd draw it if I could use ATASCII!..)

Spin-Dizzy.. yeah, I have it. Won't work on my 1200xl. I see some sort of duck-like guy and garbage and I think a score-bar. Maybe I need FIXXL? I'll try it. I think loading programs that compress would be VERY VERY VERY impressive. Mirax force (yet ANOTHER IRG for background game) could have better sound & stuff. (heck.. anything better than that roboty "GAME OVER" thing..)

Anyone work on something that plays digis WITH the screen on AND while doing other things (a musicbox/sound commander type thing for digis?) Probably'd suck tho.. oh well.. it's not as if everything's been made for these little computers!

1244. Re: "Multi-tasking" software

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-13 04:12:10 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <Z74JHB9w164w@cyberden.uucp>
Source record: 112036

Well.. oopps.. my fault.. I shouldn't have said multitasking.. Jeff's
right. More like better task management. Heck. I think I'll even just
start work on a TurboBASIC "environment" that ENTERs files
(ie-accessories all go the same area in the program, etc.) This'd be
pretty slow & dumb, but I might try just for fun. I could see Action!
doing it, I guess- with modules. Except anyone who used it would need
Action!, wouldn't they? can you load/overwrite modules AFTER compiling?
I made a little demo, just to let my self imagine ONTO the screen, that
had a little menu bar that said "system files help", then you hit a key
and a systems menu dropped down with "games>","calc","color",etc. You'd
hit a key and see a window-menu pop up with a list of games, hit a key, a
tetris screen'd pop up, hit a key, a menu on the tetris screen moved from
"new" to "quit", press something, back to the old menu, press something
select "bricks", press something, see a brick game menu.. etc. etc. Just
to let myself get the feel as to what I'm planning. I've decided to call
it "Binky".. Binky-desk, Binky-Term, Binky-write, Binky-Publish,
Binktris, Binx (desktop, terminal program, wp, dtp, tetris, klax... hehe)
Just a name I got from an episode of Count Duckula. (Binky was a
demented scientist's sock hand-puppet..) I have lost it, haven't I? ;)

Well.. perhap's I'll wait til Action!, perhap's I'll wait til
assem.lang.editor, perhap's I won't do it at all.. maybe get someone else
to. I'd just like the ability to say "I'm bored, I'll play t
tetris a minute and finish it up afterwards.." or "
I need a calculator!".. etc.
oh well..

Source record: 112052

I'm not much of a program, but hints if you want to try, or someone else.
First there are mouse drivers for the atari, an ST mouse plugs into a joystick
port, and sends a sequnce of pulses, (up,down or left,right) by noting the
order it is possibal to determine the directin and speed.

As for joystice, I've seriously considerd a mod emulate cursor keys, which would
help for menu systems. It could be either page 6, or OS mod.

Well.. like I said before, they took it down. One thing gets me tho.
The "sysop" now (there's now 1 major runner of the system), Bob Brodie
(head of communications at Atari Corp.) uploaded himself a file named
COMKILL.ARC and for the description said something like: "An Atari 8-bit
game of some sort. We still care!". Thing is, it's NOT a game. Also,
there is >1< 8-bit message area and >1< 8-bit file section, when there
used to be at least 4 or 5 of each! Now there's 20 ST sections! (they
changed to FoRuM St and a newer ST system). I still think they need to
TEST files beFORE they validate them for download! On the "old" Atari
Base (the old 5-line Michtron system.. still up, but not for long) used
to take DAYS to get something validated. I wonder if any of IT was
tested. There was a file (a copy of AWESOME.DCM) that was DL'd over
>100< times, and did NOT work! (I downloaded it at LEAST 5 myself..)
Why don't these people NOTICE these things!? I'll bug them about it.
Hell, I'll see if I can be sigop!!! Bill Kendrick

I tested the YY glasses on the Star Trek title. Only one good effect
(actually, it wasn't the title, was it... before the title.) I also
tested it on Mirax Force and Zybex. Neither looked any better. Just
made my eyes hurt (notice the warning on the glasses!). It actually
helps the red/blue glasses from the Simpson's mag. It darkens the blue.
Normally, my left eye starts feeling wierd, and I can tell that the image
is too dark. The shaded part of the YY helps to darken the blue to about
the same as the red.

Gee.. it looks like BIGDEMO >is< EXPO91. Does it say "THE ATARI EXPO
1991" in a flag waving text when you first load up? Then next is some
REALLY awesome music (which has been added to Klix... always gotta
mention that!) and a spiffy DLI with "POKEY" at the top written out of
pulsating boxes. Is this the one?

> It is great you are doing this!!
>
>
> Jeff McWilliams

(hehe.. GREAT!? yeah, RIGHT! somebody's going to have to make a better,
faster version. This is in TURBOBASIC.. perhap's I'll wait until Action!
to do it, as some of the code in the PKZip "how-to"ish file was in 'C'
and it shouldn't be THAT difficult to go from C to Action!.)

Umm.. advantages. Well, it's used a LOT.. I mean A LOT! Now, I know
we're not all going to go out and download IBM games and stuff, but
remember, this isn't just IBM and this isn't just games/programs/etc.
GIFs, textfiles and that sort of thing, which WE CAN view/use are in
Zipped format. It's just that we have no unzipper.

Does anyone out there have good text files on [un]zipping? It'd REALLY
help. God, so much to do.. so little brains... err.. uh..

I'll see what I can do. It has recognized the filename and other
parameters of the one zip I've downloaded so far for testing. THe only
problem is all the "disk number" and "directory" and stuff that's been
encoded. I've used variables for every single peice of data I've taken
out, and half of it I probably don't even know. I'll probably just
display it.. (as if the person using it would care.. but still... any
excuse to make a chart!!)

God.. it's 2 in the morning! Well. count Friday out for doing
unzipping!! ;)

|>
|> What sort of problems are people having with UTIL???
|>

The problems I am having (and at least one other guy are having) concern writing (to floppy) a binary file from the IBM. No combination of "/W /B" seems to work: UTIL always apparently converts ASCII C/R's to ATASCII. This obviously wreaks havoc on GIF and ARC files, where these codes mean something else entirely. I have only been successful transferring UUE files, which means an extra step is required.

BTW, does the IBM's floppy disk drive always seem to write one sector, move the head back to the center and move it back out? I'm a little concerned about wearing out the stepper motor on the IBM!

First thing is you can't have a disk drive turned on or the BASIC cart enabled. I can double check since mine still works, but isn't hooked up, but procedure goes something like(?) computer off & everything but the modem off, turn on computer while holding down the option key. You may have to hold the start key down too(?), but you should hear a varying tone comming out of the monitor as the software loads.

Source record: 112049

The Trenton Computer Festival 1992 will be held at Mercer College on
Saturday, April 11 (9-6) and Sunday, April 12 (10-4).

This year's festival features:
- The world's largest outdoor personal computer FLEA MARKET
- Over 170 National Vendor and Commercial Booths, featuring AST,
Adobe, Aldus, Borland, Microsoft, Lotus, Corel, Micrografx,
Toshiba, Hewlett-Packard, WordPerfect, Intel, Symantec,
Software Publishing, and local vendors.
- More than 125 FREE Seminars, Forums and Talks on all aspects of
computing.
- Thousands of dollars worth of door prizes, including an AST 386SX
notebook computer, an HP color printer and an HP color scanner.
- Saturday evening banquet features keynote speaker, Paul Grayson,
CEO of Micrografx. Tickets are $20 each.
- Admission:
General: $7 for both days; $5 for Sunday only
Students and Seniors: $3 for both days
Preschoolers accompanied by adult: FREE
Other Children Under 12 accompanied by adult: $3 for both days,
FREE on Sunday only

Files with all kinds of good information are available for anonymous
ftp from pilot.njin.net (128.6.7.38) in pub/TCF/tcf. They include:

what.is.TCF - history and description of TCF
gen.info - general info about TCF, directions, parking, etc.

1992 TRENTON COMPUTER FESTIVAL

TCF needs lots of volunteers to be a success. This year, volunteers are eligible for special prizes in their own drawing!

By volunteering four hours of your time, you will also receive a free two-day ticket to this year's annual Trenton Computer Festival, April 11-12, at MCCC, a colorful cap and a free lunch ticket.

Volunteers work in several areas, as needed by the organizers. Some of these are (1) helping Security to direct traffic, (2) helping speakers and people attending talks, (3) providing general information to attendees, (4) selling tickets, (5) helping in the flea market area, (6) helping in the vendor areas, (7) checking for tickets at the doors, and so on.

Thank you for volunteering. Have fun!!

I. Personal information:

NAME:_____

HOME (Evening) TELEPHONE:_____

WORK (Day) TELEPHONE:_____

II. Please make three choices from the list below:

SAT:6-10 SAT:10-2 SAT:2-6 SUN:8-12 SUN:12-4

First choice:

Second choice:

Third choice:

Return the completed form as soon as possible but no later that April 1, 1992. You will receive a telephone call from the coordinator of volunteers telling you when to report. Go directly to the lobby of the Theater Building on the MCCC campus to get your tickets, cap, etc. and your assignment.

Thanks a lot for helping!

Pete Holsberg
Steering Committee

1261. Re: Joystick/mouse control of cursors

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-14 03:29:39 UTC
From: crow@coos.dartmouth.edu
Message-ID: <1992Mar14.032939.14571@dartvax.dartmouth.edu>
Source record: 111805

I once wrote a simple assembly language program that read the joystick port and based on the signals, issued cursor-control keystrokes. I believe I patched it into the vertical blank interrupt. The one problem I had was that the VBI is called too often--I needed to keep a counter and only enter a keystroke every so often as 60 keystrokes a second is just too much.

Now if only I knew where I put that program, I could send you a copy...

By the time you read this you will probably have had 1001 replies!
What about the .ALF format? I use it regularly, in fact I always make
an ARC and an ALF for anything I want to compress and then use the one
that is the smallest, sometimes it's ARC and sometimes it's ALF! The
actual ALF file is called LZ.COM.

Well, I have De Re Atari and I think it is one of the best programming
reference books that I have seen.
Chapters include the following...

Antic and the display list
Graphics Indirection
Player Missile Graphics
Display List Interrupts
Scrolling
Sound
Sound generating software techniques
The OS
DOS
Atari Basic Overview

There are also appendices covering..
Memory Utilization
Human Engineering
Atari Cassette Overview
Television Artifacts
GTIA

Also included is a laminated 8 1/2 x 11 programmers reference card
with stuff on ANtic Modes, IOCB structure, USEFUL OS equates,
selected hardware registers, etc.

Hope this helps.

1265. my 1200 baud modem

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-14 08:21:38 UTC
From: jmansfie@zeus.calpoly.edu
Message-ID: <1992Mar14.082138.156698@zeus.calpoly.edu>
Source record: 111806

First off, let me say that I'm kinda ignorant about the technology
of my 800XL and I don't really know that much about the software, etc.
And, don't laugh, I'm still at 300 baud.
Anyway, I picked up this old 1200 baud hayes compatible awhile
back but haven't been able to figure out how to hook it up or what
software I'll need to use it. It has a parallel peripheral cord. The
modem is called Bytcom 212AD and it's got 6 buttons on the front and some
DIP switches inside - much more complicated than my 1030.
Can someone help me out here? Also, what software should I use
to emulate vt100, run this modem, and be able to upload/download/etc. stuff?
Thanx for your help.... Life sure would be nicer 4 times faster!
Later,
Jason.

> publication? Can't you upload the mag to the archive for us?

Michael, Thanks for this note. Where do I start. Well from the begining
I guess. I run a BBS here in NZ called Z*NET Pacific (STaTus BBS) which
till about 18 months ago did not have internet. We now have a modeule
we have written in MCL on the Michtron BBS and also I have now installed
a archive-server on a PC under WAFFLE for one of our magazines called
Z*NET PC. Which deals with the world outside of the Atari based machines.

The server is costing me about $600.00 a month in email bills as we have
to pay for all incomming and outgoing email in New Zealand. To this
extent I have only budgeted on sending the one magazine via NET as I am
not that flush with funds that I can send all our Z*NET magazines via
the net and spend $1000.00 a month.

As you may or may not be aware Z*NET is a labour of love for all of us
out here who either write,contribute,distribute or whatever for Z*NET
we are a very non-profit making venture.

I would be happy to post to a archive-server, listserv or what ever a
copy of Z*MAG each time it is released in the USA so it is available
for all of us but I simply can not afford to _BE_ that archive for
the magazine at this stage (I need a pay increase).

>

> this.

Michael, That hurt! (Ouch) I am at a loss to why I seem to be a target
for these comments. I have over the years attempted to distribute Z*MAG
all over the south Pacific, both here in NZ and in Australia. I have been
doing this for some 6 years now and it has cost me from my pocket
thousands of dollars during this time. Where you chaps are in the USA
not 12,000 miles away like me and get it from a multitude of local USA
based sources with out to much time and effort. Gee a phone call connect
to CI$ or GEnie a few years ago to do this cost me $6.60 a MINUTE and it
to 45 minutes to dload, so I get a little hurt from comments like tha
above Michael.

As I stated I am more than happy to post it to a archive-server in the USA
just tell me an address.

>
> So you know that my goal is not just to gain access to Z*Mag, I'm very
> interested in doing a "Persuing the Internet" type of column for Z*Mag.

Could somebody post a generic list of 8-bit mail order shops? I've received San Jose's flyer, and it was quite skimpy.

Thanks!

1272. Re: Joystick/mouse control of cursors (BASIC listing)

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-14 18:04:24 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1992Mar14.180424.3772@magnus.acs.ohio-state.edu>
Source record: 111812

>The one problem I had was that the VBI is called too often--I needed to
>keep a counter and only enter a keystroke every so often as 60 keystrokes
>a second is just too much.

I wrote a similar program several years ago. Location 1614 controls my
counter; POKE 1614,1 after boot-up for a fast cursor, higher values for
a slower one. The default is three I think. This program also uses a VBI.
I have source code to it if anyone wants it.

To make it work, simply capture the following message and then ENTER it
from Atari BASIC (i.e., ENTER"D:CAPTURE", where D:CAPTURE is the filename
of the captured file. Several ERROR statements may appear during the ENTER;
this shouldn't cause any problems, but can be avoided by editing everything
but the actual program out of D:CAPTURE using your favorite word processor.).
Once the program is ENTERed, RUN it. You need only run it once, after which
it may be deleted.
The program creates an AUTORUN.SYS file which resides on page six. Moving
the joystick in any of the eight directions causes the cursor to move.
Diagonals were implemented by a two-step process, since the Atari doesn't
have any key codes for diagonal cursor movements.
Many popular word processors may be appended to the AUTORUN.SYS file
created by this program, e.g., to add joystick cursor control to WORDPROC.OBJ,
one would type from DOS 2.0/MyDos:
C
WORDPROC.OBJ,AUTORUN.SYS/A
Unfortunately the program conflicts with many popular word processors,
since it eats page six. It could probably be made relocatable or maybe
fit on the stack.

>e-mails, and 46 new on c.s.a.8!..interesting)

Portal has had the same experience. Maybe something has affected West
Coast (USA) distribution of this group. Other groups seem to have been
flowing normally. Can anyone NOT reading this on the West Coast tell
us whether they've noticed this "ebb and flood" effect?

>Now.. let me answer a few of Chris's questions. [...]

Why, thank you. :-)

>1. I got Bob Puff's UnLZH version 0.1 (or UnLZARC 0.1.. I forget) from I
>beleive BAAUG BBS here in the SF bay area. Perhap's it was ABACUS BBS..
>[...]

Hm. I'll be interested to hear what you find out about it. I guess I'm
less interested in it now than I was at first, because someone recently posted
that they'd heard from Bob Puff that the program wasn't supposed to have
gotten released..

>[...] As for what Font 4 is (as well as 1,2,3 and 3.1).. there are BASIC
>Font Editors. [...] ...when I make a version from scratch, I add 1 to it.
>If I edit the version after a while of use (this was befor I got a modem), I
>add 0.1 to it, so I/you can tell that it's much like the previous ?.x
>version, but (hopefully) better. [...]

That's very professionaal of you. Do you program for a living? I do.
(Although ont on the Atari, hehehe...)

>As for Klix.. as I've posted, I got the instruction manual, and will
>hopefully start the dirty-work this weekend.. (this is also in
>TurboBASIC.. I >DO< need a "many-sprite" routine... somebody? ANYbody!?
> It must'Ve been published somewhere! It's not THAT hard, is it?
>(well.. it is for ME!.. Mr.BASIC!)

I believe ANTIC once printed (maybe in '86 or '87) a ML routine that
through careful timing allowed you to display the same Player/Missile
simultaneously at two different horizontal positions. This would work
as long as the two positions weren't too close together (and, of
course, didn't OVERLAP...). That ought to permit the "upper half" of
the Klix display, and then a carefully-wrought DLI might handle the
moving "paddle" that can carry a stack of tiles to ANY horizontal
position...

>Chris, I did try the ^I thing.. and look it worked! (hehe :->)

Hoo hah! Great! Glad to hear I helped you out. It's always tricky learning the details of a new telecommunications connection: each pair of systems seems to have its own quirks. (I've seen UNIX systems where the ASCII DEL character is used for what the Atari calls "BREAK" -- now imagine if you'd hit TAB while using one of THOSE systems: you'd have pressed TAB, transmitted DEL, and caused a program interruption!)

>Well. I guess that about answers all of Chris's questions and comments..

It sure does...

> And Chris, you'll be the first to get a copy of Klix!

Why thank you! I'm flattered!

>(be patient, my
>son... the knowledge will come... ooh.. sorry.. beginning to sound like
>Star Wars/Trek!)

Heheheh... "I'm sorry, Obi-Wan; gloating over my first-Klix-recipient-hood was very un-Jedi-like -- and Captain Kirk (* should this now be "Picard?"), I'll consider myself on report and will beam down as an 'extra' on the next mission..."

>BTW!: Going to see if I can add "PINTS WAVE", "DIAGONAL WAVE", "OOH" and
^^^^^^^^^^
The British ought to love you for that! It must be just like a "beer frame" when bowling... hehehe...

>"AAH" and all that Jazz into Klix! (getting Parrot (soon, I hope!))

Hm, I have a Parrot Jr. that may or may not still work (didn't the last time I tried it, but you never know); wouldn't it be cool if you could digitize the "Ooh" and "Aah" right off a Lynx itself? :-) (And the "Oooh" voice -- female -- on the Lynx KLAX is so sexy, I have to wonder what she was doing when she MADE that sound, and whether she knew she was being recorded! And how does she feel now, about her voice being part of a game that has found its way into so many hot and sweaty young hands!!!! :-))

Urrr.. I can't actually ANSWER this, but if "oswego" means Oswego, NY
(you can tell by whether you got ~60" of snow this past week!) then you're
not TOO far, relatively speaking, from Computer Software Services in
Rochester. I'm sure THOSE guys can fix it in ANY case. (If you BRING
the drives to Rochester, drop me a line, we can do lunch...)

..
>I like having "x:" and "x#:" device specification, rather than "A:" and
>"B:" and that on IBMs. Atari's are really good in their own special way!
..

I like this too. You can name any file, any device in exactly the
same way, much like UNIX does. When I learned to use unix, I was pleased
that Atari had done something similar.

1278. Binky

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-15 08:26:59 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <oB6NHB1w164w@cyberden.uucp>
Source record: 111828

Well.. for my little screw-around job Binky (the name has no meaning.. I just liked it), I got the pointer working, a Brick game accessory can be installed and played, and then played again without re-installing. The concept has become limitless. Sorta like the ST/Mac/Amiga/Windows environments. The only difference here is it's not in a GUI, just a text interface that can handle pointer, windows, menu bars and menus. I'm going to work on games for now (since I'm in the mood). They'll include Tetris, Klax (perhaps..), Chess (perhaps..), Checkers, Reversi, Mah Jong (probably not), some card games, and anything else I can get out of thos old 1970's BASIC Games books I've mooched off of old programmers. Other accessories will include a calculator, file viewer, all sorts of little .COM files (SILENCERs, R:handlers, no 80 col.E: handlers, tho, as they can't handle POKEs, which is what this uses the most (MOVE routines and the such)). The actual programs I have in mind would be wordprocessors, spread-sheets, desk-top-publishing (??, graphics may be needed here), perhaps a psudo-programming language (would make a program file, delete itself, and load the program.. not too efficient, though). I try to imagine how fast Binky would run on a system with a RAM or hard drive. The loading of programs will still be longer than normal in BASIC, as the ENTER command has to slowly tokenize everything (I'd give up case-insensitivity for speed any day!) Games wouldn't be too impossible in this interface, especially since I'm making limited ones as accessories (limited in the sense of space.. 5000 line limit) I'm guessing the program will take 10000 or so lines to itself, 5000 for .accessories, and leave 18000 or so to the application. I'm not saying that TurboBASIC is the best language to program something like this in, though. I just only have BASIC and TurboBASIC and nothing else. I'll probably make something far better in Action!, IF compiled Action! programs (modules, actually) can be merged. I know that Action! modules can be merged using the cartridge (this is what I've taken from the little I've heard of it), but as I said, I'm not sure about the compiled programs. If this was impossible, then people'd be stuck having to have Action! to run this stuff, and I think that isn't too good. Oh, also another major help with Action! (other than the speed and better structuring) is the fact that I happen to have a bit of source code for windows! (I wouldn't mind having horizontal scrolling, but I could live with this module's vertical!) Does anyone out there have Action! that I can either purchase (or have, if you're willing!), or that they can compile this window demo with, and then mail back the results (loadable by me, who has nothing for Action! EXCEPT this bit of code)??

Any help would be gratefully accepted. (and noted in any credits if I get this thing off the ground and out of TurboBasic!!) I'm willing to pay up to $20 or $30 for an Action! cartridge at the moment (HOPEfully.. it's up

to my dad!) Thanks a whole lot for reading this far! ;) Bill

Message-ID: <1g6NHB2w164w@cyberden.uucp>
Source record: 111827

Does anyone have digitized stuff? (sound samples (music or instruments)
or graphics (esp. animations... perhaps in COLOR?! :)) Very interested
in starting a collection. I'm going to start making my OWN collection
once I get my digitizers... (Parrot & CompEyes which threw me back a
whopping 20 bux! God, I'm lucky!)

Also, does anyone know exactly what type of filters I need to do good RGB
digitization? Do I need profe$$ional one$, or could I use just plain old
3d glasses?? (that'd be interesting for a color & b/w digitized mix..?)

please mail me! thanks!

```

Jon,

I'm glad you responded; it has explained a lot.

You have offered to supply the archive with new issues of Z*Mag. You may
send them to our 8-bit Archive Moderator, John Dunning, at

jrd@stony-brook.scrc.symbolics.com

Since my last posting I have contaced Ron Kovacs directly and plan to send
send him my first article next week.

Could you try sending me e-mail, so I can find a working address for you?
None of my Internet accounts recognizes status.gen.nz as a valid address,
and I know others have experienced the same.

>Could someone please post a list of generic mail order...

Okay, here's my current listing...

Software Infinity
642 East Waring Avenue
State College, PA 16801
Notes:Good PD selection. Also now
marketing commercial European
imports.

B&C ComputerVisions
2730 Scott Boulevard
Santa Clara, CA 95050
(408) 968-9960
Notes:Huge selection of software
and hardware items. Also some new
commercial games, unavailable
elsewhere.

Page 6
P.O. Box 54
Stafford ST16 1DR
Good European commercial & PD
selection of software. Also are
the publishers of New Atari User
magazine...see below.

Micro Discount
265 Chester Road
Streetly, West Midlands B74 3EA
England
8-bit commercial close-outs.

Telegames
Box 901
Lancaster, TX 75146
8-bit and 2600 software.

Gralin International
11 Shillito Road
Parkstone, Poole, Dorset BH12 2BN
England
Fairly good selection of commercial
8-bit software/hardware.

Steve Hoffee/K.O. Software
333 Peninsula Drive
Lake Almanor, CA 96137
Markets a selection of imported
commercial & PD software.

Sagamore Software
2104 Arapahoe Dr.
Lafayette, IN 47905
Good PD/shareware selection with
extensive documentation.

Change In Heat
12 Bella Vista Place
Iowa City, Iowa 52245
Independent programmer has produced
2 excellent commercial quality
games for the 8-bit.

Bresnik Software
555 Ware Street
Mansfield, MA 02048
Another independent, producing good
educational software.

UltraBasic
10 East 10th Street
Bloomsburg, PA 17815
8-bit speciality software.

NERDS Software
18 Wendy Drive
Farmingville, NY 11738
Printshop related.

IB Computers
9244 S.W. Beaverton-Hills Hwy
Valley Plaza Shopping Center
Beaverton, Oregon 97005
(503)297-8425

BellCom
PO Box 1043
Peterborough, Ontario, Canada K9J7A5
The largest PD/shareware selection.

Compsult
PO Box 5160
San Luis Obispo, CA 93403-5160
Closeout items galore.

No Frills Software
800 East 23rd Street
Kearney, NE 68847

Closeouts & Printshop graphics.

Miles Better Software
219/221 Cannock Road, Chadsmoor
Cannock, Staffordshire WS11 2DD
England
Excellent mail-order source for
the Atari. They have many games
which were never released in the US

Electronic Clinic
4916 Del Ray Ave.
Bethesda, MD 20814
Refurbished equipment.

Mars Merchandising
1041-B East Charles Road
Lombard, IL 60148-2059
Close-out software.

Kake Software
9 Smith Ct.
Vincentown, NJ 08088
Assorted theme disks.

Bacmun Software
1671 East 16th Street, Suite 629
Brooklyn, NY 11229
PD theme disks.

Alpha Systems
1012 Skyland Drive
Macedonia, OH 44056
Utility software & hardware.

American Technavision
15338 Inverness Street
San Leandro, CA 94579
(415)352-3787
Large selection of commercial
software at excellent prices; also
hardware replacement parts.

Best Electronics
2021 The Alameda, Suite 290
San Jose, CA 95126
(408) 243-6950
Known as *the* Atari hardware
store. If they don't have the
part you need, nobody does.

BRE Software
352 West Bedford Ave, Suite 104

Fresno, CA 93711
PD/Shareware.

C&T ComputerActive
PO Box 893
Clinton, OK 73601

Discount Video & Computers
1717 South U.S. 1
Fort Pierce, FL 34950

Palette Imaging
1 Closter Commons STE 789
Closter, NJ 07624-0400
(201) 767-3913
Offers new 1991 professional
quality ChromaCad modeling
package.

MWPDS
890 North Huntington St.
Medina OH 44256

Phantoms Atari 8-bit
Box 331 Levisa Road
MouthCard, KY 41548

Vulcan Software
PO Box 692
Manassas VA 22111-0692

Innovative Concepts
31172 Shawn Drive
Warren, MI 48093
(313)293-0730
accesories, hardware, PD software

CSS
PO Box 17660
Rochester NY 14617
(716)586-5545
8-bit hardware upgrades, 8-bit
repair service.

San Jose Computers
640 Blossom Hill Road
San Jose, CA 95123
(408)224-8575
New and reconditioned hardware,
as well as lots of software.

Entertainment Excellence
1805 Princeton Place

Merrick, NY 11566
Discontinued 8-bit software.

East Hartford Computer
202 Robert Street
East Hartford, CT 06108
Discontinued software for all
computers.

Aerion Software
PO Box 1222
Riverdale Station, NY, NY 10471-1222
Markets a new 8-bit commercial
game.

Toad Computers
556 Baltimore Annapolis Blvd
Severna Park, Maryland 21146
(301)544-6943
Offers a selection of software
and reconditioned hardware.

Novatari XL/XE PD Library
C/O Geoffrey Dimego
8612 Thames Street
Springfield, VA 22151

TEAC (The Educators Atari Club)
PO Box 1024
Laytonville, CA 95454

AEL 8-Bit PD Library
C/O Bill Marcum
PO Box 34183
Louisville, KY 40232

When writing to request catalogs,
it's always a good idea to include
a Stamped, Self-Addressed Envelope.

Next, is a list of magazines still
supporting the 8-bit Atari.

Current Notes
122 North Johnson Road
Sterling, VA 22170
A truly excellent Atari-oriented
magazine, supporting both 8-bit
and ST.

AtariUser
113 West College Street

Covina, CA 91723
Newest Atari publication covering
the full line of Atari products.

Atari Interface Magazine
3487 Braeburn Circle
Ann Arbor, MI 48108
8-bit and ST support, with good
listing of national user groups.

Page 6 / New Atari User
P.O. Box 54
Stafford, ST16 1DR
England
Glossy British magazine supporting
mainly the 8-bits, along with a
few ST articles. Excellent.

Atari Explorer
29-05 Broadway
Astoria, NY 11106
Mostly ST, occasional 8-bit article

PSAN

1282. DOS XE public domain? Other Atari DOSes now at archive.

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-16 00:44:21 UTC
From: jwd@en.ecn.purdue.edu
Message-ID: <1992Mar16.004421.22160@en.ecn.purdue.edu>
Source record: 111824

Does anyone know if Atari's DOS XE is in the public domain now? I bought it directly from Atari for $10 a couple of years ago. I don't use it anymore but it is nice in some ways since one may go to this DOS without first loading the equivalent of a DUP.SYS from disk even if you are using a 600XL/800XL/1200XL/65XE without expanded memory. If someone can tell me for sure that it is indeed in the public domain I will upload a disk-commed image up to the archive just as I have uploaded DOS 2.0S, DOS 2.5, and DOS 4.0.

1286. Turbo 816 board

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-16 04:21:23 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92075.232123JJMCWILL@MTUS5.BITNET>
Source record: 111835

Well, I am thinking of letting go of my Turbo816 board from Dataque Software.

This is what I have...

Latest revision Turbo816 board,
containing 16 bit 65816 CPU at 1.79mHz.
256K SRAM card
32K SRAM card with time/date chip and PROM code
which will set the SpartaDOS clock when executed
from the Turbo Menu.
65816 Assembler from Dataque Software
65816 Machine Monitor/Debugger written by Jeff [Alfred] WIlliams
Dual OS version of the Turbo OS ROM. Hooking a switch to it
allows the 16 bit OS in one position, XL OS in other.
All disk text documtation printed and in a three ring binder.

I paid close to $400 for all this when I purchased it. I am not sure
what Dataque is currently asking for the stuff. I understand the
last T816 boards he had were shipped to the U.K. with no plans to make
more unless 25 or more are ordered. I suspect the software and hardware
would go from Dataque for about $420.00 or so.

If you have a reasonable offer, email me. The worst I can do is
moan a lot and refuse! :)

Does anybody know what's in the 3 files called DOS20S.ARC, DOS25.ARC, and DOS40.ARC which were recently uploaded to the 8bit section of the archives? Would whoever uploaded them please contact me? Thanks...

1290. more PD at the archive

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-16 14:29:46 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar16.142946.22798@aber.ac.uk>
Source record: 111831

I've just put a few more bits of PD up at the archive. At the moment they are in new of course, and are called: script80.arc (an 80col WP which works without any 80col hardware), dvc_c.arc (a nice C compiler), analog_disk_side1.arc and analog_disk_side2.arc (a double sided disk of some stuff from analog mag.). The PD I last posted has now been moved and renamed: bash_a_drum is now in the main directory and is called bashdrum.arc. Rain_down_demo is in demos and is called raindemo.arc.

1291. Digi-Studio Distribution

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-16 14:44:45 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar16.144445.25326@aber.ac.uk>
Source record: 111832

Nobody has thus far come forward to distribute Digi-Studio in the US or other countries.

For those of you who may be interested this is all you have to do:

Method 1 - you buy copies in amounts of say 10 or 20 at a time from me at trade prices and sell them in the States at profit. I have already produced a demo disk of Digi-Studio which is finding its way nicely on to BBSs. It is also on the archive and on compuserve. A lot of the initial advertising has been done. ZMAG issue 204 also carried my press release.

Method 2 - you act as an agent. This involves no up-front money. State-side orders are sent to you and paid for in US funds. When you have collected say 10 orders, you send me the names and addresses and payment in UK funds and I send copies from the UK. You would get a commission for doing this, possibly 10-15% of takings.

Method 3 - you get duplication rights. This is my least favoured method because of copyright laws. Here you gain the right to produce legal copies of Digi-Studio and send them out yourself. You would send me a copyright holders fee for doing this. This fee is, however, likely to be as much as 50% of takings.

If anybody is up to the challenge then please email me on: djg0@uk.ac.aber

Dean Garraghty.

ATARI INTERFACE EXPANDS -- OVER 100 CLUBS, MORE DISTRIBUTORS

Ann Arbor, MI -- In this time of shrinking economies and worries about continued Atari magazine support, Unicorn Publications is pleased to announce that Atari Interface is continuing to grow.

User Group Expansion

With the March 1991 issue, Atari Interface increased its number of Participating User Groups to over 100. Currently, there are 105 user groups whose members are receiving Atari Interface magazine as part of their club benefits. "We're over 100 clubs now and we expect a fair number of additional clubs to sign up in the next month or so," said Editor Bill Rayl. "At least 20 more clubs have indicated they want to start getting AIM for their members."

More Distributors Added

As recently announced in messages on CompuServe and GEnie, Atari Interface has expanded its US distribution to include approximately 250 additional Walden's bookstores. AIM is also being carried by two independent distributors in the US, as well as three overseas. Signing up in the last two months have been Micro-D (Canada), Braden Ray (Australia & New Zealand) and Bath Publications (UK).

Unicorn Publications has been producing an Atari-specific magazine since December 1987. For more information, contact Pattie Rayl, Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, phone: (313) 973-8825 voice, (313) 973-9137 BBS.

From: brj@terminator.cc.umich.edu
Message-ID: <1992Mar16.232012.10183@terminator.cc.umich.edu>
Source record: 111847

Hi, has anyone reading this sold a 8-bit system
lately? How much are they worth these days? Is there
any kind of blue-book for used computer equipment?
I have 2 800XLs, 2 1050s, a Gemini 10X printer,
a 1030 modem, and miscellaneous other accessories
that are just too much hassle to cart around with
me when I move.

1294. Indus GT syncromesh at boot-up

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-17 00:32:48 UTC
From: entropy@gnu.ai.mit.edu
Message-ID: <ENTROPY.92Mar16193248@wombat.gnu.ai.mit.edu>
Source record: 111839

As anyone with an INDUS GT knows, there was a cute little program
included with the DOS-XL that would put the Indus into "syncromesh"
mode. This could be made even more useful if you took the time to
patch the program with a sector editor so that it didn't try D1:-D8:
but only D1:-D<your-max-drive>. This made startup a little faster,
but still very slow compared to full-tilt syncromesh.

I had heard that Indus later developed a version that worked on
boot-up so that the entire boot-sequence would go faster. Alas, I
didn't order this when it first came out, and when I tried recently to
call Indus Systems, I got a disconnected number.

Anyone have a copy of this they want to sell, or know how I can get it
from Indus? (Are they out of business or did they just move?)

Reply in email or followup to this newsgroup.

Thanks,
entropy

>of the floating point space on page 0, $D0 to $FF, using the same
>rationale that allows me FR0. Did "Mapping" describe this wrong?
>Can I use the remainder of precious Page 0?

USR is a "function." When you call something like "X = USR(FOO)", on
exit from the USR, BASIC pulls the valueof variable "X" from FR0. Sometimes,
you'll want to have BASIC parse that value (meaning you've probably manipulated FR0 in your
code), sometimes not ...
just using USR as a gateway.

If your USR routine does nothing with Floating Point, those FP register are
pretty much available. I've used $D4-$F1, $F5-$FA, and $FC-$FF pretty freely
and had no problems. (knock on veneer ;-)

1297. Re: Util.exe

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-17 05:52:48 UTC
From: dam1@ra.msstate.edu
Message-ID: <1992Mar17.055248.3847@ra.msstate.edu>
Source record: 111840

The only problem I have ever had with util.exe is using a high-density
drive on the IBM to write to the Atari floppies...my 1050 was not very happy.
I am using the util.exe in the file util.arc at the archive...there is also
a ataridsk.arc and pcxfer.arc but the util.exe files on these arc files have
earlier dates...util.arc includes the source code util.c and atario.asm...
I have used util.exe several times with no problem as long as I used a 360K
drive to do the copying...

1298. Demos and DIGIs

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-17 07:25:02 UTC
From: a644690c@edinboro.edu
Message-ID: <00957B2ABD22B8E0.20200BCE@edinboro.edu>
Source record: 111851

Since there has been a bit of talk about demos and digital sampling lately, I thought I would throw in my $.02 on the subject(s). There is a GREAT digi-music demo that keeps the screen on and has some cool osciliscope type animation on the sides of the screen. It is called the YOUR-BODY demo. Another digi-sound demo is the last portion of the Expo '91 demo (by Frankenstien of the High-Tech Team). It Has a cool digi drum and base bit. The BIG demo from the High-Tech Team (HTT) (the BIG demo is NOT the same as the Expo '91 demo) has 2 long playing digi-tunes as well as a lot of cool effects otherwise. There is an Expo II demo which came from Stiching Pokey that also has some digital sample coolness in it. Some real fun ones are Perestroyka and The SKY Network demo. These are designed for use with two 8-bit systems and will play a variety of digi-drum/pokey-synth songs in stereo across the two systems (great fun with a stereo amp and/or headphones :-)

As far as Data compression goes: The World Federation of Mad Hackers released 3 demos called TOP parts I, II, III. Parts I and II have a lot of cool stuff but have MANY problems due to the PAL vs. NTSC problems. Actually most European demos don't function totally correct because PAL machines have %12 more VBI time. If the PAL VBI routine does not finish before the NTSC machine starts its next screen, there can be many problems (NOTE: The shaking screen syndrom is the most common). Anyway, The TOP III demo (as well as the other two) use runtime decompression quite a bit. There is one demo that does an animation that is even being decompressed on the fly. Most of the others just load in, decompress, then run.

A good source of information on this kind of stuff is MEGA MAGAZINE a disk magazine that was an off-shoot of the High-Tech Team from Holland. The Magazine is completely disk based and has some pretty cool stuff on it. Many months ago, before I had net access, I was pretty much the U.S contact for this magazine. I mentioned to Frankenstien (of HTT) that I didn't think the magazine would work well in the U.S., so we havn't talked about it much lately. I assume he/they are still putting it out and if anyone is interested, I will forward the info to MEGA MAGAZINE.

Before my idle babblings get any more out of hand, if will journey onward.

Peace, | 'I think I found the Trix Rabbit

1300. Sound samples

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-17 11:32:16 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar17.113216.8103@aber.ac.uk>
Source record: 111842

Bill,

Over the last 5 years I have been working with the Replay sampler and have produced many digitized music demos and software which uses samples in some way or another. Of course, Digi-Studio is the latest of these. Most of the other software is PD, and I shall be putting them on the archive as soon as I finish my dreaded Ada project! I will probably be putting DSIL, Music Machine, Journey into sound demo, Long digitized demos 1&2, megablast 128K, and DMS when I get around to changing the programs and docs to make this PD (DMS was the forerunner of Digi-Studio, but no where near as good!!). For some hints and tips on sound sampling, read SAMPLING.DOC in issue 1 of my news-disk (this is available at the archive in directory "djg" and called issue1.arc). This article is also forming the basis of a presentation I'm giving tomorrow here at uni about sound sampling!!

Message-ID: <C152-BV.92Mar17125837@dv349-5a.berkeley.edu>
Source record: 111848

In article <rdshepherd.700853896@node_e88a> rdshepherd@lescsse.jsc.nasa.gov (Rickey D.) writes:

I have Homepak's (Yuch) Hometerm, and I have Proterm, and a 1030 modem. A friend MAY be able to get me a copy of Chameleon (vt100 emulator for atari).

Ikes! I used to have that modem. 300 baud is just too slow for these days, though (but then it's better than nothing).

The questions I need answers to are:

1) What should TERM be set to, to get Usenet in a form that is readable, without losing ends of lines, or having everything unformatted, making it hard to read?

What I would do is get Kermit or some other terminal program which can do 80 columns (or get the XEP80). I used some VT100 emulator (from the atari archive) which scrolled back and forth to get 80 columns (which is what Chameleon also does), though it was rather hard on the eyes after a while. In this case, you would set term to 'vt100'.

2) Are there any particular things I should set using the stty command, to make things function properly? (Like linefeed, erase, etc.)

If you have a good VT100 emulator, you can just type 'stty dec' and leave it at that (which is what I use). I found that nothing could handle 7 bits, though.

Any help would be much appreciated. Also, please post it here. Email does not usually work at this location. Hopefully, that will be remedied when I get the new account working properly.

No problem. Hope all goes well.

Thanks in advance,

No problemo.

Rick Shepherd

>Didn't they put it out on the ST?

Is there any implementation of Spindizzy that doesn't use flip-screen
technique? I don't think the size of a game is impressive if it has
to pre-calculate graphics each time I exit the current "room". If you
disagree, then look at a fractal generator. There is not much data
needed to create a view, but most often you get an incredibly huge
"world" of locations to visit. And don't you think rooms in Spindizzy
are very similar?

Just my opinion. Keep on packing.

I think this is a very clever technique. And for "Gateway to Apshai",
didn't the Atari 800 conversion use scrolling over the entire level?
I find games that have to pre-calculate any new room i decide to enter
most annoying.

Before I bought the cartridge (for the Atari) I used an illegal
copy on tape (please forgive me). The biggest drawback with having
"Gateway" on tape was that it had to be reloaded when you got killed
for the last time. Was this because level data were spoiled when
playing it, or was it for some other reason?

Did you, Mike, work for (at?) Epyx before the company was named Epyx?

Source record: 111850

Lots of question that I have had in me head for long time come out now....
1) How do you display text in Assembly using the E: device.
A really neat example would be helpful....

2) After compiling a program and getting the .COM file in
LightSpeed C...how do you get the program to run WITHOUT
having to have the RUNTIME.OBJ file in the darn directory...
I have appended them to eachother but nothing works.

3) How the heck do you use Kyan Pascal?

4) Of the two most popular Kermit/VT100 emulators in the Archives....
Kv3.7 or whatever and the really good other one that lets you
remap your entire keyboard! how the heck do you get the second
to do a binary download at 2400baud using 7-?-1? IT ALWAYS
messes up...cant go back and forth between 8-E-1 and 7-?-1?
Also why cant I use the XEP80 card with kv3.7 when it says I can....
I only get 40 columns in all the text modes.

5) Who has an action cartridge / development system for sale?

6) Who has STATIONFALL for sale?

7) Who has the Atari Macro Assembler for sale?

8) Who has a Mac65? Assembler system for sale?

9) Who will be brave enough to take the time to answer these questions.

Andrew

Message-ID: <1992Mar17.230613.13658@ge-dab.GE.COM>
Source record: 111849

I've recently talked to Bob Puff, who's the programmer who wrote the
Super UnLHArc code that was released for beta testing *and no other purpose*.
He is quite angry that it has gotten out and been posted on bulletin boards.
Please respect his wishes to not release this program since it is not
complete. Bob is one of the premier shareware developers for the Atari
8-bit, and if we don't respect his wishes, we have nobody to blame but
ourselves if another programmer decides to leave the 8-bit computer for
"greener pastures" (my words, not Bob's; Bob has no plans to abandon us).

So don't distribute any copies of his UnLHArc program!

Well.. I've seen an ST mouse driver in the GOE demo. I have no ST
mouse, so all I can do is use the joystick. And that makes the pointer
go sideways (90' compared to the joystick). I'm sure someone has
something to do this with.

As for the joystick->cursor emulator, I have one, called TPJOY.COM. It
supposedly works in TextPro (haven't tested it as I only use AW+). It
does NOT work in AW+ (AtariWriter+). I'm not sure about BobTerm, but
then again >WHY?< and it returns CONTROL+arrow key-strokes, so I had to
modify it for DeTerm (the funky pull-down menus..) The one major problem
is it's speed. If you have an xl/xe, type POKE 730,1 and then use the
arrow keys.... zoom!.. That's how this works, and I haven't tried
messing with it to slow it down, so it's mighty useless in DeTerm. In
DOS and BASIC and all that (including TurboBASICXL, and I'll suppose
FrOst BASIC as well), it works just fine (for the speed..) But remember,
it was meant for TextPro, so it might not work in everything. I've
checked it and it does install into page 6 RAM, and I'll post a BASIC
installer as soon as I find it and login to Internet again.
c-ya

NO DeRe! Oh.. you're missing out! Ok.. here's a summary (well, of the
table o' contents):
system overview
antic and the display list
graphics indirection (color registers and character sets)
player-missle graphics
display list interrupts
scrolling
sound (this is a VERY good section, IMO)
sound generation software techniques (ditto)
operating system (I have a 1200xl, but the only copy of DeRe I could get
was the old 400/800 version.. is there an xl/xe ver.?
or was that just Mapping?)
the disk operating system
atari basic overview

And the appendices:
memory utilization
human engineering (interesting section indeed)
atari cassette overview (far too long a section for the 90's!)
television artifacts
gtia

and a pretty good glossary.

Do you have Mapping, as well? Now THAT's good readin'! ;) Actually,
it's come in handy every once in a few.

Oh dear. Action! died on you? Tough luck, it seems. OSS died quite a few years ago (remember reading that in a back issue of Compute!, back when it supPORTED 8-bits!). They said that ICD (I believe) was going to hanlde it all from there. But lately I've heard that THEY either died, or dropped 8-bit support. Looks like you're going to need to find a new Action! cart! (I need one too, if anyone's interested in selling?? hmm?)

```

Daniel Martin (dam1@Ra.MsState.Edu) writes:

>The only problem I have ever had with util.exe is using a high-density
>drive on the IBM to write to the Atari floppies...my 1050 was not very happy.

Oh. I forgot to mention that. "UTIL only works with the '360K' type of
IBM drives." These are called "low-density" drives among the PC-literate.
UTIL specifically DOESN'T work wiht the '720K' or "high-density" PC drives.
I wish I could remember where I learned this, but it ought to be added to
the UTIL.EXE distribution on file at atari.archive ...

Heheh... I have a few Parrot Jr. samples of myself and some friends
goofing around and of a radio program "jingle" one of us made back in
high school... surely you don't want THOSE... ;-)

I also have a 256-level-grayscale image of ... mySELF! That I have
plans of converting to Graphics 16 and uploading here for all of my
fans (cough cough)... someday... :-)

>Also, does anyone know exactly what type of filters I need to do good RGB
>digitization? Do I need profe$$ional one$, or could I use just plain old
>3d glasses?? (that'd be interesting for a color & b/w digitized mix..?)

For best results your filters should approximate, as closely as possible,
the colors which will ultimately be used to reproduce/display the image.
In this case, something which closely approximates the exact Red, Green,
and Blue colors your Atari can cause to be displayed. This may or may
NOT mean matching a TV/monitor's R,G, and B phosphors, depending on whether
the Atari can even put out a "pure" R,G, or B signal. Given that you're
going to lose a lot of precision in even the best case, I'd say "screw
it," and just use any old red/green/blue filters and keep trying til
you get acceptable results! :-)

I work in color imaging and can tell you that color science fills many
thousands of books with many, often contradictory, theories about how
best to represent a "large" color range using a "small" number of pri-
mary colors. If you saw the books you'd give up on it altogether, so
just TRY stuff until you get an image up there!

Subject: Time:11:28 AM
OFFICE MEMO Antic/STart Magazines Date:3/18/92
Hello Atarians -
This is probably a FAQ, or at least old news, but does the publisher of Antic and STart Magazines still exist somewhere? When my Antic Disk subscription turned into a STart subscription (Nov. '90?), I called and cancelled because I'm still an 8-bitter, and it didn't look like much would apply. I was promised a $33 refund. Now, my cards and letters are returned, and they left no forwarding address of phone number. Any info on them?
Thanks for the help!

Well, I can't handle everything, but a few anyway (maybe). If you read your Lightspeed manual, I think somewhere in there the author says you can distribute Lightspeed DOS with your programs, so if you have something you want to distribute, you can just use DISCOM to send out the whole tamale. W/O the compiler/editor of course. Once someone has the DOS, further programs can just be sent out individually.
Most of the stuff you asked for can be had from B & C Computervisions in Santa Clara, but hope someone will offer to sell you the Carts used. I think The Atari Macro Assembler goes for about $20, but the OSS carts are over $70 each. May be an old number, but (408)759-1003.
A few more details would help, but to output text from ASM & it is just going to a graphics(0) screen you can just assume channel #0 is open. If it's for any other mode you have to use ch#6. Or I think you can use ch#6 if you don't want the normal cursor positioning [up,down,etc.] to work. I'll send a solid example, but you just load the IOCB #0 with the print line cmd (#9?) make the buffer length longer then your string, point the buffer address to your EOL terminated string, LDX #0, & JSR through CIOV. Whew! No wonder every one like basic!

>
> Chris Chiesa
> Chris_F_Chiesa@cup.portal.com

To the best of my knowledge, the way such games pack such huge backgrounds into 48 and less K is by the "stamp" method. Part of the graphics code defines "stamps," i.e. small sections of memory that make up the background picture. Such stamps could include grassy sections, rocks, moon bases, etc; basicly whatever your background is composed of. Then a number is assigned to each stamp. The background is then made up of the numbers corresponding to the stamp. A good example of this is the GR.0 screen. Each character in the character set is defined in memory, with a number assigned to it (ATASCII). Now when you create a screen filled with GR.0 characters, it takes around 1k of memory, + the few odd K for the character set. This takes up a lot less memory than a corresponding GR.8 screen of the same image would. If you think of twenty pages of text, using the GR.0 method you would be using somewhere in the region of 20K. A GR.8 representation of the same images would take up somewhere in the region of 140K (someone please correct me if I'm wrong). Now, I'm not saying that all games use this method, but as you can see (hopefully) this method does save a heap o' memory.

Source record: 111914

To all those asking about using ComputerEyes digitizing cameras to
try to produce COLRVIEW (GR.9) picture files:

Obtain the following filters (Kodak Wratten Gelatin Filters):

No. 25 (Red)
No. 58 (Green)
No. 47 (Blue)

Make three exposures of your subject (preferably something that remains
still), one with each filter in front of your lens. Use a daylight
balanced light (BCA No.1) if you require artificial light. Name the
three files with the same (8-character or less) filename, with extensions
.R, .G, and .B. They should load correctly under COLRVIEW and display
in full color. Your quality may vary. These filter and light suggestions
are from a professional photographer who has produced such pictures for me.

I also wrote, a long while back, COLRCODE, which converts three GR.9 images
to one APAC file, if anyone is interested (it's on GEnie).

The Atari 8-bit club I am a member of buys and sells a lot of hardware amid ourselves and from those leaving the 8-bit community. Average prices, depending on condition, are:
800XL $50 - $75
1050 $40 - $75 doubler drives add about $10 - $20
Gemini 10X $75
1030 MODEM $15 - $25 (300 baud isn't too popular)
Hope that helps; if you decide to sell let me know as I will share with the other club members and maybe both parties can get a good deal.

>hell of a DOS no less. We wouldn't use anything else.

Is Turbo Basic XL different than Turbo Basic which came out a few years
back? If so, what added features does it have?

Do you KNOW what that would mean? Music while screen on? You would have to be ready for the ANTIC to enter in. It is possibal to use VBI to know when ANTIC is accessing memory, and then timeing the program tightly so that ANTIC always takes over at a kowen time. BUT there isn'T really enough time as it is to continuellously update the screen. If you want digi music and a screen at the same time use two Ataris, one slaved to the other (through joystick ports)

> pandora@kcbbs.gen.nz
>

Actually, the .ALF format is almost identical to the _crunch_ that ARC does. SEA's ARC utility (and I assume Bob Puff's) use one or more of 4 different methods of compression, depending on the analysis of the file. STORE (obvious), PACK (repeating charactor compression), SQUEEZE (A Huffman encoding [weighted Binary Trees]), and Finally CRUNCH which is a Dynamic Lepel-Ziv-Welch encoding. ALF is just a form of this LZW compaction. LZW really works best with things like text, but can be adapted to work fairly well with Binary files (which Huffman trees were really designed for). In the 16bit world (and even 8080 - 8088 machines, I guess) LHA.COM (usually pronounced L H Arc) is fairly common compression program which uses LZW and creates .LZH files. I beleive this is just and improved method over that used by ALF.

Though I don't have LZ.COM, I bet that if ALF created a smaller file, ARC also tried to use its CRUNCH (denoted by a C in SEA's ARC) but was slightly less efficient. I guess its just a matter of point of view as to how many compression methods exist for the 8-bit.

If your interested in another 8-bit data compaction program, I might get motivated and finish work on one of my own I started long ago. It was not based on either of the 2 common methods but instead a rather strange way of shuffeling bits around and collapsing them. It was an idea that I came up with one day and sketched out on paper. Though it worked VERY well on paper, I was never really able to figure out an efficient way of coding it. Maybe I'll get back to it someday :-).

Source record: 111920

Hi everyone,

Only 2 people have responded to me about the zip file (1 knew about it, and 1 didnt... nobody has this file ? the zip file of games ?)

Also, I thought I'd inform everyone about an annoyance of UTIL. It seems someone complained about the drive writing then tracking to track 0, then writing, then tracking to track 0, until finished. Well, a quick look at the ATARIO.ASM file (the PC assembly low level routines) shows the cause of the annyoance. The program resets the disk system after every write (why I dont know ?). This has the annoyance of also setting the heads to track 0 (thats part of the reset disk system bios function). When I get some free time, I plan on modifying it to only do a reset disk system upon an error or start of an io period.

While writing to a disk which should not have ran out of space, I got an out of sectors error, then the thing endlessly looped tracking all over the disk, doing who knows what ..... anyone ever experience this one ?????? I'll have to do some more examining of the source.

Also, a person mentioned having problems with UTIL's switches.... another quick examination of the source discoverred that UTIL uses the argc function to determine the number of arguments (switches, filenames, etc) however, a space must separate each item inorder for the method of parsing to work. Therefore, you must do:

UTIL /W /B a: myfile.ext

to write a file using binary transfer mode.... have fun listening to the heads go in out in out in out in out.... while this might be good for some things, I certainly thing its not good for disk drive head alignment !!!!!!

When I get around to straigtening out some of UTIL's inconveniences, I'll let everyone now, and will upload my modifications/discoveries/ documentation/etc ?

Also, If anyone is interested, I have made a XL/XE translator that loads the original Atari OS rev A OS. Reverse engineering the ANALOG Home made translator revealed an intersting modifcation choice that I believe should have been placed one byte later in memory... however, since I did not fully document what I had discovered, I cant elaborate further... but since the HM translator works, I put the change for OS rev A in the same location.

I also came up with a great idea on how to program a software backup tool that removes copy protection checking.... it works by allowing the

software to load, then dumps the entire memory along with the stack, and the system reset vectors and a few other things..... Does anyone out there know if this is how Chipmunk worked ? If not, does anyone know how Chipmunk worked ? Does anyone have Chipmunk ?

Also, does anyone have the Archiver/Chip II (for 1050 drives). How does it work ?

Anyone have an extra good Tandon head assembly for a 1050, or an extra Tandon mech. ? How about a 6507 1050 drive CPU ?

Anyone have an extra Omnimon XL with or without Omniview XL ?

Anyone have an extra 810 mechanism (the eject button type... early 810, not the ones with the IBM PC style flip out door...)

Anyone have an extra 800 preferably with 16K....

Also, I have an ATR8000... nice piece of equipment... however, it puts a hum in the audio of both the TV and the audio out line of the monitor jack. It appears to be generated by noise on the data in line to the Atari SIO connector. Anyone know how I can stop this ??????? PLEASE!

Well, enough is enough, and I'll let you all take a break after reading this unbearably long msg about so many things.....

One more thing: Anyone know if Mission Impossible by Epyx was released for the Atari 8-bits ?

Thanks,

-- Curt

jrd@STONY-BROOK.SCRC.SYMBOLICS.COM (John R. Dunning) writes:

> Does anybody know what's in the 3 files called DOS20S.ARC, DOS25.ARC,
> and DOS40.ARC which were recently uploaded to the 8bit section of the
> archives? Would whoever uploaded them please contact me? Thanks...

Ok.. I'm gonna guess... and probably be right. DOS20S.ARC is probably an ARC of Atari's DOS 2.0S (2.0, single density) back from the era of the 810 and 815 (which, BTW never came out to my knowledge.. people probably have them, just like people have the 1090xl). It is just the single density DOS for the 810. DOS2.0D (2.0, double density) is for the 815, which was a doubledenstiy drives. (yes...a drives... it was two stacked, I believe). It's a menu driven DOS (if you've never seen DOS2.x or MyDOS, this is just a DOS that lists selections between "A" and "P"(?) or "V"(?) (I forget, I never pay attention to the menus anymore. DOS2.5 has one more selection than 2.0_, and MyDOS has many more than either).. you enter the letter of the selection, and it will prompt you for parameters (ie."A"=disk directory, then you can enter [RET] for a full directory, a "*.BAS", for example, for a searched directory, and you can also add ",P:" to list it to printer, or any other device/file you want a copy of the directory written to other than the screen))

DOS 2.5 is an upgrade of DOS 2.0_, which was made for the Atari 1050 "enhanced" (1.5) density drives. This DOS looks much the same on the menu (the DUP.SYS file), but the DOS itself is made a bit different to handle the strange density of the good 'ole 1050 drives. This ARC will probably also contain some programs such as RAMDISK.COM (a RAMDisk installer), DISKFIX.COM (a disk verifier/file uneraser) and some other little tidbits.

As for DOS 4.0, I think it is for the XF551 drives? (the double density/double sided drives that I think Atari made MAILY because they were out of stock and not making any more 1050s, and they didn't want to get sued by Nintendo for false advertising the drive capabilities of the XEGS... this is only what I've heard, it's probably wrong...)

Other hybrid DOSes exsist, mainly PD versions of the 2.x's.. they handle such things as US Doubler and Happy 1050/810 upgrades. You can get them from a few PD suppliers (2 out of 2 I have lists of, 100%, but probably not THAT distributed..)

2.0S and 2.5 came with the 810s and 1050s (respectively..)
4.0 I'm not sure about. I'm not even sure if it is the xf551 DOS, but it probably is. From what I know, the DOSes came out like this:

DOS 1.0 -> for the 810s.. died quickly because of bugs, etc.
DOS 2.0 -> (S and D) for the 810s and 815s. Too bad the 815s never
really got around!
DOS 3.0 -> for the 1050s, but quickly removed and replaced with 2.5,
because of major incompatibility with the 2.0_ series (one
of the files on my 2.5 master disk is COPY32.COM, which
copies 3.0 files to 2.0 format)
DOS 2.5 -> replacement for DOS 3.0 (my 1050 box says 3.0 all over it,
but has big yellow stickers cering them up that say 2.5
is included.)
DOS 4??? not sure past 2.5.. well.. c-ya! Hope I helped in
choosing which one, if any that you're going to get! Bye!

The original version of Turbo Basic could be run on a 48K 400/800 system.
Turbo Basic XL loads into the top 16K of an XL/XE system, giving a larger
FRE(0)[more free memory] than Atari Basic. Turbo Basic XL also comes with
a compiler and runtime package.

The noise could be coming through the SIO connector's Audio In line. I think the only devices that actually use this line are cassette drives and the 1030/XM301 modems. You could cut or unsolder this line on the ATR8000, or make a special SIO cable with that line disconnected. The audio input line is pin number 11.

>.ARC format.

By the time you read this you will probably have had 1001 replies!
What about the .ALF format?

One reason not to use ALF format is that the programs that know how to
deal with it live only on Atari 8-bitters. That means that it's
impossible to look at, test, or extract things from them on anything
else. I know there are users out there that like to, for instance, copy
things from the archive onto their local vaxen or suns or PClones or
whatever, look at them there, and download pieces to their 8-bitters.

That's why just about everything in the archives is in ARC format; I
often use my ST or a sun to package stuff up, and it's much easier to
use a format that does the job, and is as close to universal as
possible.

{
F{F

Ok...
some people have been asking about something that can control the cursor keys by using a joystick. The following is the JOY.TXT file (instructions), and the JOY.LST (assembly language listing) from the TPJOY.ARC ARC file. This routine was made mainly to control the cursor movement in TextPro, but can work in BASIC and DOS (why!?) and other programs. (I've tested AtariWriter+ and it didn't work. I also tested DeTerm, but needed to change from up/down/left/right to -/=/+/* (no CONTROL), but it was too fast.

After the 2 text files from the ARC are 2 BASIC listings I made that create JOY.COM and JOYINI.COM. These routines are just page 6 routines, and only take up 96 bytes. Remember to use the proper one!

If you want, just stick this post on a disk and ENTER it from BASIC. Then delete lines 1->20 for JOYINI.COM, or 101->120 for JOY.COM.

Note that I added a "." to each line from JOY.LST (the assembly language file), to keep those lines from being ENTERed as BASIC and give you tons of lines with "ERROR"s on them. If you want to extract the assembly, use a wordprocessor (can the asm.editor edit as well... perhaps use it.)

Files follow--

Joystick handler for TextPro.

Have you ever wanted to sit back and
just scroll through a long letter in
TP using a joystick? Well, here is
how.

The file JOY.COM is a ML routine to
add joystick scrolling (it can be
used with other programmes) which
adds the following commands to
TP456.

Moving a joystick in the first port:

Left: goes left
Right: goes right
Up: goes up
Down: goes down

Left, with trigger: goes left
one word.
Right, with trigger: goes
right one word.
Up, with trigger: goes up
one paragraph.
Down, with trigger: goes down
one paragraph.

How to use it...

With Sparta.DOS, have your startup
batch file load JOY.COM before TP...
with MyDos (4.53) put JOY.COM on as
JOY.AR0 and TP as TP.AR1 to load the
handler first.

If you are using DOS 2.5, do NOT use
JOY.COM... instead append TP to the
end of the JOYINI.COM file (use:

C [RETURN]
D:TP.COM,JOYINI.COM/A)

The reason for this is that SpartaDOS
is VERRY picky about how a file ends.
One cannot end it with an INIT
address, but MUST use a RUN address
(as JOY.COM does) while JOYINI.COM
ends with an INIT address (I BELIEVE
that JOYINI.COM could be loaded from
MyDos without a lock up, but NOT from
Sparta!)... thus JOYINI.COM has an
INIT address rather than run address,
and so can have a file appended to
it.

(The reason for this difference with
SpartaDos is that SpartaDOS ALWAYS
has a RUNAD EVEN IF YOU DO NOT
SUPPLY ONE... in that case it takes
the starting address of the file
load... so you can not run a Sparta
file with just an INITAD - unless
of course you start your file with
a load of an RTS to some unused
address... in that case, you can
use an INITAD, as the RUNAD does
nothing... but usually, one does
NOT write utilities for Sparta that

can be separately loaded or appended
to... usually it is one or the other
or two versions, as I have
done here)

The routine resides in page 6, so it
will be incompatible with other
routines you may have there... the
source code is included (JOY.LST) in
case you want to reassemble it to
some other location (for
compatibility with, say, the keyboard
buffer Ronnie Riche included with
TP4.54).

It is not protected from RESET (so if
you go to DOS and press reset, it
will have to be reloaded before going
back to TP)... but TP protects itself
(and the whole environment) from
VBI initialization on RESET, so
pressing RESET from TP will NOT
remove it (TP does not protect user
handlers, which is why the user mod
to the keyboard handler used in
the PROKEY buffer R.Riche included
with TP454 is not protected).

Try it, you'll like being able to
scroll about your letter with the
speed and ease of a joystick.

I've got a 48k 800 with a REALLY busted keyboard. My son aka "The Teenage Village Idiot" pulled off & lost a dozen or so keycaps & broke the switches so it can't be saved without extensive hacking or a new keyboard. I've got an OMNIMON Xl that isn't plugged in, it may be a spare, if you need it I'll check. Computer can go for cost of shipping, I don't have access to a free copy machine right now, so I'd want about $15 for the Ominmon, wait, I may have the original doc somewhere? I'd still want $10 though 'cause I paid $39.xx for it.
I believe Chipmunk used a predefined backup scheme, but don't know for sure.
American Techna-Vision has all kinds of parts (800)551-9995
Oh & yes, you'll grow old waiting for me make it to the post office. Good intentions, but busy. Don't send money<grin>.

Bill,

Yes, they are dropping the 8 bit, but said they would still support the products, whatever that means. I am hoping it means maybe he can at least have his cart sent in and looked at. Gods, it doesn't take that much to buy a $5.00 EPROM and copy a Action! cart lying around the ICD offices onto it, effectively repairing the damage done to the Action! cartridge...

>Well, I can't handle everything, but a few anyway (maybe). If you read your
>Lightspeed manual, I think somewhere in there the author says you can
>distribute Lightspeed DOS with your programs, so if you have something you
>want to distribute, you can just use DISCOM to send out the whole tamale.
>W/O the compiler/editor of course. Once someone has the DOS, further programs
>can just be sent out individually.
Wrong, you are linking in the wrong code. You are linking in the
little routine which loads the RUNTIME from DISK. Instead, link
in the whole RUNTIME package, whichever one is smallest and has the
routines you need, and then the whole program will be a complete package
capable of being run on "any dos".

> the system reset vectors and a few other things..... Does anyone out
> there know if this is how Chipmunk worked ? If not, does anyone know
> how Chipmunk worked ? Does anyone have Chipmunk ?

I have Chipmunk. I don't think this is how it worked, rather it
rewrote the original code that checked for the errors on the disk.
To learn more about all this stuff, one should read Atari Protection
Techniques and Advanced Atari Protection Techniques which covers
just about every protection scheme used in the Atari computers, and
gives an overview of what almost EVERY hardware or software package
did to remove the protection. Exceptions I think are some of the Newer
CSS stuff, but it still worked on the same principal. The Archiver
II, to my knowledge, just does the same as the Archiver except now it
also works in Enhanced Density.. I don't recall anything being
distributed like this, Maybe Silent Butler?

> Also, does anyone have the Archiver/Chip II (for 1050 drives). How
> does it work ?

I've FINALLY figured out the BART sender at the archive. FINALLY!
I'm wondering... cc65 is 'C' language, no? I have cc8, myself, but no
linker. Does cc65 need a non-pd linker? I didn't see a linker in the
cc65 directory (then again it may be within an ARC...?) I DID however
notice a runtime file. Can that be attached to any compiled file, or is
it like the TurboBASICXL compiler, where you need to first Load the
runtime and then tell it to load another file (or have the other file
named "AUTORUN.CTB").
I
I'd send for the doc.arc, but it's pretty big (I've already sent for a
ton of stuff I'm SURE I want), and also I'm going to be out of disk space
as it is! I just freed up a disk for the indexes (I accidentally
(unknowingly, actually) sent for the ST index as well.. gee- I ran out
of ink! >:-P) Oh well... (man does that happy face look like line
noise, or what!?) thanks for any info in advanced (so then if I forget
to thank you when you mail it to me, you won't feel as bad!!! j/k!)

Why are there no "digi" areas. And why is the demo. section so small.
Looks like I'm going to have to send KAL.COM and STYX and whatever other
demo.s I've gotten here and there to the archive.

When I get my digitizers (well.. I haven't PAYed for them yet, but the
deal was send, test, pay) perhap's I'll see if I could get a section
there for demos. and pics. and sounds and the such.
How big IS the archive? How many megs. has it used up out of how much
free?? (digi's, esp. sound, can take a lot of space for what they do!)

Also, am I correct in assuming that "swandemo.arc" is actually
"fujispin"? (the 3d rotating fuji sign with a swan and "130XE"/"ATARI"
flipping below that..) That reminds me, I'll have to also send
"robtship" (robot/ship), yet another old demo straight from Atari. Nice
graphics, tho!

```

1350. util.exe

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-20 11:23:56 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar20.112356.27967@aber.ac.uk>
Source record: 111937

Right, here are the problems I have discovered with util.exe so far. I use it with 1.2M drives which works but there are problems. The first problem is it won't read a disk formatted on the Atari. I get a "5 errros reading sector" error, or something like that. Therefore, you must format using the util program on the PC. But, the Atari then won't read that properly. The 1050 just hangs and the head steps back and forth. The way to get around this is to help the 1050 out. Before putting the disk in the 1050 manually spin the disk so the timing hole is visible. Thenput it in the 1050 and it will work.

I have also found the problem when it runs out of sectors on the disk. It tells you it has no more sectors, but still tries its hardest to write to the disk. There is no way of stopping this. If it happens, reboot the PC. The drive will make a horrible crunching noise. I don't think this does the drive any good!

One other problem is when formatting a disk using util. Sometimes I get a "error formatting track 0" error. But, when I format it again all is well. Very odd!

It sounds like the 130XE keyboard is oxidizing (sp!?). This is a common fault with XE keyboards. Try using some electrical contact cleaner spray from Tandy (or Radio Shack or whatever you call it!). Give it a good spray and see if it helps. Where abouts is the mould growing? If it's growing inside the keyboard itself, i.e. inbetween the back plate and the front keys, then throw it and buy a new one. Repairing XE keyaboards can be damaging to your sanity!!

Dean Garraghty. djg0@uk.ac.aber

If you can find one, there's the MIO, or the Black Box that you can get from CSS, or VERY soon, ther will be The KPI (K Products Interface) from K Products (the owners of BBS Express Professional). If you don't want to spend alot of money, and are looking for a "straight" hard drive interface (without the RS-232 interfaces and other add ons), you may want to consider the KPI. It is based on the old Supra Hard Drive Interface. It has been modified to include a menu based system for configuring, and so it's a more flexable unit, meaning that it can easily accept many different types of hard drives. It'll be able to handle systems going up to 1 gigabyte (a MASSIVE amount of storage for a 8-bit computer) and will go for between $15 to $200 ($250 max depending on how they decide to put together the final product). It will connect to the PBI in the back of an XL, or with an adapter for the XE. This information comes from Bob Klass, owner of K Products, someone I consider a friend and have met on one of his many trips to the Twin Cities area. I also stay in CLOSE contact with him for I am a SysOp of a BBs and choose to run his bbs program (BBS Express Professional).

Hi everyone,

Only 2 people have responded to me about the zip file (1 knew about it, and 1 didnt... nobody has this file ? the zip file of games ?)

The huge zip file full of games has been removed from the archives because at least some of the games in there are pirate copies of copyrighted software. The guy that posted it is trying to figure out which one's are legal and which are not; when he does, the legal ones will be put in the archives.

No, I'm not trying to reignite the debate over copyrights, it's simply not worth the hassle. Besides, the archives are in a precarious enough position now; if the university management finds us publishing copyrighted software, that's just one more bit of ammunition they'll use to shut us down.

Source record: 111856

Well, I don't want to jump into a flame, but there's quite a bit of stuff on the topic in the ST sig. From what I've heard, the owner solicited renewed subscriptions, articles, advertizing then used the money to start a PC mag (PC Home Journal????). In his defense, I've heard the rumor that a number of advertisers were a year behind in their payments to Antic/Start. Writting on the wall, with the Atari market dieing he then formed another company and transferred ownership of the PC rag to it. His line is something like he was just selling off assets to pay bills & it just happened that his new company just happened to get the PC rag. The new company is not responsible for the debts of the old. When & if it gets resolved, it will probably be in court. I've got a few lawyer friends & they said (about other stuff) that a contract that is just to avoid fiscal responsibility can be voided. For instance; just before you lose a $1,000,000 lawsuit you sell your house to your brother for $1 so it's not your asset. I don't think it'll go that far because the new entity does not have enough bucks to interest the lawyers <g>.

1358. Stuff for sale

Well... I'm not exactly sure. Is TERM like Translation on most other
term. programs? I'm on a remote BBS (it's run on an IBM, I believe). I
have duplex to full, translation to Atari. That, as well as baud, are

all I need set (and they are all auto-matically set, I believe, when I make a new board on the bbs list of BobTerm's dial menu)

Perhaps you need to get a better terminal program. Have you got a disk drive? Is the s/w you have now on cart.?

You said >256< grey scale?! Are you sure you don't mean >16<?

Also, you said Graphics 16.. That's just graphics 0, "without a text window", but since it HAS none, all it is is gr.0. You must mean graphics 9 (16 shade). What APACView is is gr.9 (16 shade)+ gr.11 (16 color) to make 256 COLORS. What ColrView is is 3 gr.9's (r/g/b) making 4096 colors. Can't WAIT. Finally figured out the archive! Yipee!

1361. Atari SUES Nintendo!!! :)

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-21 04:13:27 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <5kXyHB5w164w@cyberden.uucp>
Source record: 111939

Sued Nintendo for $160 million, and will get 3 times that amount
if they win the case. Atari says that Nintendo has monopolized the video
game industry, not only hurting it, but obliterating it.
Nintendo has retaliated saying that Atari Inc. (the Atari before Atari
Corp., back when Warner Bros. owned it) had a chance to introduce the
/
that Nintendo is having a hard time with competition from Sega
Enterprises.

I read the article about this in _The_Atari_Zone_, the newsletter of the
Atari Video Club (A.V.C.). The original article was written by Dan
Iacovelli, editor of _TAZ_, and he compiled it from information he
aquired
on the Dow Jones section of Prodigy.

A.V.C. is an Atari 2600/5200/7800/Lynx supporting club, and the
newsletter
also includes puzzles, contests, and information on Atari, like what's
going on with the Jaguar, the sueing of Nintendo, etc.

If you'd like a sample of the newsletter, mail a request to the below
address (please say that I mentioned it to you, and that you read it here
on Internet). If you'd like to join the club (which is a quite
official
thing, with a membership card and all that), send $4.25 to the address
below.

Please note that I'm not affiliated with A.V.C., and that A.V.C. is not
affiliated with Atari.

The address is:
Dan Iacovelli
(Atari Video Club Chairman)
1411 North 36th
Melrose Park, IL 60160-2726

Remember, it's $4.25 (check or M.O.) to join the club.
Thanks...
Bill Kendrick (still owns his 2600!)

There ya go..

r S a l e * * * * *
---
* * * A t a r i 8 0 0 X L S y s t e m * * *

- Atari 800XL - 64K computer. Good, working condition.
- Minor problem with joystick port 1. I have a
temporary solution for it.
- Atari 1050 Disk Drive - Double Density. Great condition. Used only
for 6 months.
- Magnavox mono monitor - Green screen, 80 column monitor, great condition.
Used for 6 months.
- Supra interface - Parallel interface for Atari. Works great.
- Star LV 1027 printer - 8 pin NLQ printer, very fast in draft mode.
- Prints great graphics, better than my 24 pin!
- Atari 410 Tape Drive - Working condition. Old.
- 150 to 200 floppies - Many utilities, applications, and games.
- AtariWriter Plus - word processor
- Rembrant - graphics
- Koala Pad (for joystick) - graphics
- Pokey Player - Music
- Many programming languages.
- Many other applications
- Pac Man
- Goonies
- Many many other games.
- A couple cartriges - dumb games.
- a few issues of Antics Magazine
- Atari 1020 color Plotter - Does not work very well, one of the gears is
- broken. If you can find a right sized gear,
it is easily replaced.

If you are interested, please send me email with a *reasonable* offer.
I'm a poor starving college student. :)

Well.. there was also the case of all of this company that made a bunch
of games and were promised by Nintendo that their system design wouldn't
be changed. But when Nin. finally released it, these peoples carts.
wouldn't work with it. Talk about wasted r&d money! I never heard any
more about that case. I hope they won. I never did like Nintendo. I
don't particularly LOVE Atari Corp. (crap) anymore, either. Really bugs
me. At least there are nice guys out there supporting the 8-bits.
BTW: Thanks for your $.02, <x>...

Source record: 111941

You would need an MIO (very hard to get) or a Black Box (available from CSS).
The basic Black Box runs about $200. Once you start running a hard drive you'll
wonder why you ever put up with floppie drives.

>
> UTIL /W /B a: myfile.ext
>
> to write a file using binary transfer mode....

You may also find that the command switch characters (e.g. /W) must be entered in UPPERCASE; I vaguely remember someone pointing out that this is due to a munged test somewhere in the C mainline... using " = " instead of "==" in a check for identification of the switch(es) or something...

> Also, does anyone have the Archiver/Chip II (for 1050 drives). How
> does it work ?

I believe I've heard that the Archiver/Chip II works by reading TRACKS, rather than SECTORS, from the disk. You see, in much the same way that standard file-oriented operations "hide" the details of boot sectors, VTOC sectors, directory sectors, next-sector links, etc., the "get sector" operation itself hides, in the drive controller chip, additional information that tells the controller itself, where to find "sector # such-and-such" on the disk. The Archiver/Chip II would read an entire track, including sector-address and sector-identification information. This is how you can "look up" such things as the specific sector order on the disk, duplicate sectors (two sectors on the disk with the same number), extra sectors, etc. etc. etc. -- just write the disk at a "lower level" than the standard "sector-level" available through the standard Atari disk controller. That'd be the Track level.

Forgive me if this doesn't make sense; I'm writing it at 2AM and I'm a little groggy!

Source record: 111860

Hey.. why did I not know about ChromaCad!? When did this come out? I just got a catalog from Amercan Technavision and was totally surprised to see those wonderful pictures of rendered stuff! My GOD! I want this! I'm wondering, though, what the memory/system requirements are. I only have a 48k (64?) 1200xl. (in my little 1200xl booklet, it said 48k, with an extra 16k only certain software can use...??) Would this include something like Turbobasic which can "hide"??

Also, this goes mainly to Jeff Potter, is "Technicolor Dream" an APAC program? It says "The Ultimate 256 color Graphic Art Program"... I might get this for $9.95 from them if it is. If it's just another paint program, no thanks. I wonder, was RAMBrandt ever fixed up to do APAC pictures? I know of a company that made a version for xmm801 printers which I'm going to get (hopefully soon). (need ca$h!)

Please give me any info. on these 3 subject, people! Thanks...
bill

Bill,

Why didn't you know about ChromaCAD? I don't know, since both Atari Interface and Current Notes had reviews of the program, and Marver (the program's author) placed full page ads in both those publications.

Speaking of AIM in particular, the review of ChromaCAD appeared in the January, 1992 issue, written by Bob WOlleey.

According to information I heard from American TechnaVisions, they based their carrying of ChromaCAD on that review! (pardon my horn blowing)
grin!

Shamus Case II, has anyone ever solved all the levels??
I have been playing for almost 10 years now and have not solved it!
What a great game!

Let me hear your opinions..??

1372. Sound samples

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-23 12:49:37 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar23.124937.17125@aber.ac.uk>
Source record: 111867

Bill Kendrick mentioned putting lots of samples up at the archive. Sounds a good idea, but it depends what he means by samples. Are we just talking about sample files, or about mixed sample demos, like my rain comes down demo and all the others I've done (I will get round to putting these at the archive, honest!)? If you took the .SPL file out of the rain demo and played it, it would simply be an awful mess! All that file contains, is all the musical passages which will go into the final edited demo. Then they are edited to create proper music. These edits are coded in a simple looking Basic program, whose job it is to simply keep sending the right memory page numbers to the machine code player. Straight sample files will be useless on their own. You need something like Digi-Studio (yes, had to get some more free advertising here!!) to make any use of them.

I would like to say at this point, that although I can't really claim copyright on sound samples included with Digi-Studio, I would be grateful if samples included with any Digi-Studio packages are not posted at the archive. This would be unfair to people who have paid for sample packs (when I get around to creating some sample packs!). Thanks in advance!

BTW, Bill, my email address hasn't chnaged! I still can't mail you either!

Dean Garraghty. djg0@uk.ac.aber

Message-ID: <1992Mar23.172926.16042@usenet.ins.cwru.edu>
Source record: 111868

Atari developed DOS 4 for the built in drive in the 1450XLD. That computer
was never released by Atari - neither was DOS 4. Only later did DOS 4
make it directly into the Public Domain.

DOS XE was developed and sold by Atari to support the XF551 drive. It
was packaged as if it would eventually be included with the XF551, but as
far as I know all XF551's came with DOS 2.5.

1374. campaign update

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-23 17:43:00 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92083.124300JJMCWILL@MTUS5.BITNET>
Source record: 111869

Campaign Update
March 22, 1992

Approximately 60 more info kits will be mailed by myself to individuals later this afternoon, with more info-kits being mailed to user groups tomorrow. To date approximately 1200+ Info Kits have been shipped to individuals and user groups. Out of this, only 270 info kits have been received. There are only 25 days left before the April 15th deadline. If you have received an info kit, don't procrastinate, fill out the card and drop it in the mail.

If you haven't received an info kit, but have already sent me your address, then you should receive an info kit withing several days. If you don't, please do not hesitate to contact me. I try to be as careful as possible when processing addresses for the database, but every now and then mistakes are made. Sometimes the postal service can also lost mail, or return it for unknown reasons. Sometimes the address gets entered into the Database incorrectly. This has already happened once, and it was found and corrected.

If you haven't written in yet for an info kit, what are you waiting for? Now is your chance to help create a magazine for us, the 8 bit Atari computer users. No where else will you have the opportunity to obtain a magazine with regular columns, product reviews, and special sections just for the 8 bit user. Time is running out, the fate of your computer lies in your hands.

Jeff McWilliams

1375. campaign

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-23 17:43:47 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92083.124347JJMCWILL@MTUS5.BITNET>
Source record: 111870

Heads Up, Atari 8-Bitters!!

This Is For YOU!

Beginning 1992, the Atari 8-bit computers- and the community of USERS who still cherish these machines- have been officially discarded by Atari Corporation.

BUT WE REFUSE TO ROLL OVER AND DIE AT ATARI'S COMMAND!!

We believe there are enough of us left to pursue our 8-bit interests independently of Atari Corporation.

Would you like to see a common forum in which users, developers, and vendors can communicate? A print medium wherein advertisers can be assured of reaching their intended audience, and where users can look with confidence for information about new products? A user-oriented publication to fill the void left by the collapse of ANTIC and ANALOG?

My name is Jeff McWilliams, and I'm a dedicated 8-bit user. I want to present the Atari 8-bit community the chance to gather under one publication, one that's exclusively for the Atari 8-bit computers. A magazine that will unite our community and give it the strength it needs to survive. A forum where users can ask tough questions and find unvarnished product reviews. A magazine that will contain advertisements exclusively from 8-bit vendors.

I propose a write-in campaign to Atari Interface Magazine, asking for a separate exclusively 8-bit magazine called "Atari Classics". Atari Interface Magazine already has a strong presence in the Atari community. For several years AIM has been a combined ST/8-bit magazine whose publishers have indicated their willingness to support the Atari 8-bit community as long as interest warrants it. NOW is the time to ask them for our own magazine!

As Campaign Manager, I will act as the focus for this effort. Now, you might be wondering, "WHAT CAN I DO TO HELP?". That part is EASY!

Just SEND me your NAME and POSTAL MAILING ADDRESS. I will mail you a FREE Information Kit describing our goals in greater detail. Included with the Kit is a stamped postcard on which you can express your interests and willingness to subscribe to an exclusively 8-bit publication. (Or, if you disagree with our approach, you can just toss it away and that will be the end of it- BUT WE DON'T THINK YOU WILL!) You'll also be able to indicate your willingness to PARTICIPATE in the magazine DIRECTLY by being a regular columnist, editor, or just writing

about a special project you did or a review of a product you've used.

Ben Poehland, the former 8-bit Editor of Current Notes Magazine, is fully supporting this campaign and has offered to donate his services to "Atari Classics" when repairs to his fire-damaged home are completed later this year.

The cutoff date for receiving the postcard responses is:

APRIL 15, 1992.

If by that time I have received 500 positive commitments by postcard, they will all be sent to AIM along with a petition requesting the formation of our proposed exclusive 8-bit publication "Atari Classics". If I receive less than 500 replies, then we will know that the 8-bit community has indeed become a lost and hopeless society.

TIME IS RUNNING OUT. THIS MAY BE THE LAST OPPORTUNITY YOU WILL HAVE TO KEEP YOUR MACHINE ALIVE AND SHARE EXPERIENCES WITH FELLOW USERS.

IMPORTANT!! Only the OFFICIAL Campaign postcards will be accepted! Those responding by other means will be mailed an Information Kit with which they can register their official response.

PLEASE DO NOT SEND MONEY! If anyone wishes to assist the Campaign, they can do so by posting this release in its unmodified entirety to other on-line services, Bulletin Board Systems, usergroups, friends, and vendors. Additional assistance can be rendered by gathering names and addresses of Atari 8-bit owners and furnishing them to me so I can mail them an Information Kit.

If you're REALLY SERIOUS about keeping your Atari 8-bit classic computer alive, be sure to obtain the Information Kit and return the included postcard appropriately filled in. Every day more 8-bits get stashed in attics or closets, or simply thrown away. Atari's Classic 8-bit computers- the 800/XL/XE machines- are every bit as useful and productive today as they were in the heyday of 8-bit technology. They deserve a better fate than the local landfill!

> Welcome to my UnderWaterWorld!

Probably not. As far as I know the origional Turbo Basic is also called Turbo Basic XL just because it will only work on 64K machines with one bank of memory under the OS (ie XL, XE). From what I understand there was a later version that would work with the 800's, thus the diff in the names.

If there is indeed a new (post '88) v. of TB, then by all means correct me.

>Just got out the old 8bit and played the BEST game of all time
>Shamus Case II, has anyone ever solved all the levels??
>I have been playing for almost 10 years now and have not solved it!
>What a great game!

Oh yeah, I solved it, but I had to hack the code to get rid of the snakes
and to make your character invincible to bullets or collisions with the
beasties. That does make playing a little easier :).

The ending is really quite a let down, actually...spoiler follows.

You reach a room with 4 vertical bars going up and down like so:

```
|||| ||||| ||||| |||||
|||| ||||| ||||| |||||
4 bars that go |||| ||||| ||||| |||||
up and down |||| ||||| ||||| |||||
|||| ||||| ||||| |||||
|||| ||||| ||||| |||||
```

You ->to other room
======== ======= ======== ===== ======== ===============

You have to jump across to the other side without getting smashed by
the bars. Once you make it there, there's this room where you set
off the bomb, and it says "You've set off the bomb, now get out of here!"

So then you have to trek back through the whole place, and once you
reach where you started, it says "Congratulations! The shadow's dead
on this level." And you go to the next level.

That's it....

1380. Automated 8bit Posting Posting

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-23 21:16:02 UTC
From: a.falcon@BITSY.COOPER.EDU
Message-ID: <9203231616.AA01320@bitsy.cooper.edu>
Source record: 111875

Hi Everyone.
Is it possible for someone to arrange for the atari archive to
automatically list 8bit postings to this list? I still suscribe to the
16bit list but Im growing tired of the flame wars they have. The only reason
I still suscribe is to see a listing of 8bit postings on the archive, (and
because I have an ST in the closet & my 8bit on my desk!)
Here's a copy of the latest one:

....

Info-Atari16 Digest Sat, 21 Mar 92 Volume 92 : Issue 163

... flame, flame, a few interesting articles... (aren't I sarcastic! :)

From:
noao!asuvax!cs.utexas.edu!wupost!gumby!destroyer!terminator!usenet@arizona.edu
(Atari Archive Robot)
Subject: Weekly Posting of New Stuff
To: Info-Atari16@naucse.cse.nau.edu

drwxrwxr-x atari 1024 Mar 15 21:10 .
drwxrwxr-x jrd 4096 Mar 16 09:11 ./8bit
-rw-rw-rw- jrd 36761 Mar 16 09:11 ./8bit/bashdrum.arc
drwxr-xr-x jrd 512 Mar 16 09:11 ./8bit/demos
-rw-rw-rw- jrd 41989 Mar 16 09:11 ./8bit/demos/raindemo.arc
....

I would be willing to post any listings for a while... but would rather
see if this process can be automated.
Also, this is the editted version... I cut out a ton of ST/TT/STE program
postings... I wonder if that can be automated as well.
Who should be contaced for this? John Dunning? Perhaps someone knows.

Sincerely,
Tony

|> program, no thanks.

Technicolor Dream is indeed an APAC paint program (I have a copy). The program appeared to be made in England(?). It uses a non-standard disk save format (not DOS 2.5, MyDOS, or SpartaDOS compatible, from what I could see). The user interface isn't very powerful, but it does allow you to do some weird things (like logical XOR the entire picture with a pattern). It does have some good sample images, but on the whole I can't heartily endorse it.

|> I wonder, was RAMBrandt ever fixed up to do APAC
|> pictures? I know of a company that made a version for xmm801 printers

Another guy and I talked about patching an APAC mode into RAMBrandt, but we never got very far.

>>emulation of the Atari 8 bit. What does that tell you, folks?
>
>It tells you only that to implement custom graphics chips entirely
>in software is no easy task.

No it doesn't. Any time you emulate any processor in software you will require a faster processor to do it on, typically 5 or 10 times faster. That's why the 386SX emulates the 6502 at full speed and no faster or slower. It has NOTHING to do with the custom chips like ANTIC or POKEY. Emulation of those guys takes up less than 5% of the processor time.

If you wanted to emulate the 386SX on the 6502 (absurd as that would be) you would have the 10:1 slowdown due to the 6502 being about 10 times slower than the 386SX, along with the 10:1 slowdown due to emulation, resulting in a 386SX emulator running about 1/100th of the speed of a real 386SX. You could then make a bogus statement along the lines of "the 6502 runs 386SX software 100 times slower than the real thing. What does that tell you?". That you shouldn't write emulators on a 6502.

Look folks, realize one thing: a software emulator consists of two main parts: an emulator that converts one CPU's instruction into anothers (e.g. 6502 to 68000, 68000 to 386, etc) and a hardware emulator that emulates one machine's hardware on another. The speed of you emulator has very little to do with the hardware being emulated and it has a lot to do with the speed of the processor emulation. The Apple II emulator runs just as slow as the 8-bit emulator, even though the 8-bit has far superior graphics to the Apple II. So Jeff's conclusion is for the most part bogus.

Look at this way. A 68000 and a 386SX have almost identical "horsepower". Both are 32-bit internal and 16-bit external. At 8 MHz, the 68000 can emulate the 6502 at 50% of the normal speed, and that's not surprising since a 68000 is about 5 times faster than a 6502. At 16MHz, both the 68000 and 386SX can emulate the 6502 at full speed. So what does that tell you? It tells you that the results are completely consistent with the general characteristics of emulators, and has nothing to do with emulating player missle graphics, etc. The only reason the ST Xformer couldn't do it on the ST was because the ST hardware was not capable of emulating all of the 8-bit graphics modes. Any PC with even an EGA display is fully capable of emulating any Atari 8-bit graphics mode.

It's the same things as if you say that "because a VHS VCR can't play
beta tapes, it must be inferior." Well, yes, they're inferior, but
for different reasons. A Beta VCR can't play VHS tapes, so using the
same logic you have to conclude that Beta is inferior to VHS.

>> > Does anyone know where I can get a copy of the 8-bit emulator for the IBM?
>>
>> Darek explicitly stated (at Chicago) that his 8-bit emulator for
>> MS-DOS would NOT be distributed due to legal difficulties with Atari and

I said two things in Chicago. First, Atari has not authorized me to release
the Atari 800 emulator for the PC platform because it requires the use of
the 8-bit operating system. Secondly, demand for such a product is very low.
Very few people have called me to ask about 8-bit emulation on the PC. And
when I tried to demo the PC version of the 8-bit emulator, I was literally
laughed at by other 8-bit users.

So what does that tell me? It tells me that I shouldn't waste my time
working on the 8-bit emulator on the PC, even though you get full speed
emulation on a 386SX and 5 times the speed on a 486. I could see that
being useful to some people who want more speed out of their 8-bit software
but obviously I was foolish to waste the time.

If you really must run your 8-bit software on a PC, what you will be able
to do is run ST Xformer on the Gemulator (Atari ST emulator for the PC)
and you'll get "8-bit emulation on a PC". It will be inferior to the
real PC Xformer because you have to put with the limits of the ST version
of Xformer, which didn't do player missle graphics, etc.

Again, when I polled people asking if you'd like to see a set of sockets
on the Gemulator card for 8-bit ROMs, 3 people out of about 500 said yes.
Well, that's not worth doing to satisfy a handful of people. So as it is,
the Gemulator card has sockets for 6-chip TOS ROMs, 2-chip ROMs, and
Mac ROMs.

Please stop complaining about the lack of an 8-bit emulator on the PC.
3 people does not constitute a market!

The 1200 keyboard is connected with a pin connector...it simply slides off toward the back of the computer as I remember...then there are two screws in the back left and right that hold the mother board in to the shell. After that there are a bunch of "punch" tabs that you simply press out with a screwdriver or somthing....then you are at the chips! Just to the reverse to put it back..also I do believe the key caps pop off. As for taking all those screws out...dont unless a key doesnt work well at all... they hold very little together but there are too many screws to keep track of! 8-)

Attention all present and former Atari gamers:

My Atari 8-bit has been dead for the past several years, and I've since moved on to another computer. My questions to you regard a game I once owned and enjoyed 4 or 5 years ago:

1) Is anyone familiar with "The Seven Cities of Gold?" What company manufactured this game, and if possible, what is their address?

2) Was "Seven Cities" ever produced in IBM format? If so I'd like to get my hands on a copy.

Any help in this matter would be greatly appreciated.
Please either E-mail or post any responses as soon as possible.
Thanks,

Lance Robinson

>
>It tells you only that to implement custom graphics chips entirely
>in software is no easy task.

No it doesn't. Any time you emulate any processor in software you will require a faster processor to do it on, typically 5 or 10 times faster. That's why the 386SX emulates the 6502 at full speed and no faster or slower. It has NOTHING to do with the custom chips like ANTIC or POKEY. Emulation of those guys takes up less than 5% of the processor time.

If you wanted to emulate the 386SX on the 6502 (absurd as that would be) you would have the 10:1 slowdown due to the 6502 being about 10 times slower than the 386SX, along with the 10:1 slowdown due to emulation, resulting in a 386SX emulator running about 1/100th of the speed of a real 386SX. You could then make a bogus statement along the lines of "the 6502 runs 386SX software 100 times slower than the real thing. What does that tell you?". That you shouldn't write emulators on a 6502.

Well, what Darek says here is true. I was implying that I thought it was silly that a 386SX can only emulate a 6502 at 6502 speed when the 386SX is running at 16mHz. I still think it is silly. Think about it. You have a $1500.00 machine on your desk, with all the latest bells and whistles. You run this program, and poof, it runs 8 bit software from a 1.79mHz 6502 no faster, even though it has a 16mHz 16/32bit CPU. I am not saying this is any fault of Darek's, just that only the Pentagon would buy a $1500.00 computer to run software that is just as happy on a $60.00 computer. Use the Clone for IBM software, and use the Atari for Atari software. It's that simple.

One thing I have always been mystified about though, is why translate the code from 6502 to 68000 or 80386SX on the fly? Why not do it ONCE and then run the code as a native processor program? Then only the Hardware emulator would be running, wasting time, not the translator emulator program.

Previous experience has led me to believe that no emulator can replace the real thing. Every emulator has its quirks. Even the Spectre GCR for the ST doesn't like certain programs, and currently doesn't run System 7. Buying an emulator to run the occasional program that isn't available on that platform is fine, but expecting that emulator to act just like the REAL thing is ridiculous. You'll always be let down.

Well, I just sent out Z*Mag #205 out over the distribution list, so
if you asked to get it, and you don't receive this Z*mag, let me know,
and I'll try to fix it.

You should get the Zmag before you read this message, since E-Mail
is a lot faster than NEWS.

Also, if you would like to be put on the list, just send me some
E-Mail. There are currently 12 people receiving it now.

In some previous articles there was a lot of talking about Turbo Basic.
I understand that it is Public Domain. In that case I wonder why
a software distributor in Germany is actually selling it? He claimes
that he purchased the copyright for TB from its original owner.
Does it mean that Turbo Basic XL is public domain in the States while
it is a copyright program elswere?
I would like to know if it's possible that some software is PD in
some countries and in some it isn't. :-)

From: eg1n+@andrew.cmu.edu
Message-ID: <ldnwl=e00VocAGv1Is@andrew.cmu.edu>
Source record: 111900

I must disagree, or at least request a clarification, of the statement made that there's a 10:1 speed reduction in emulating a processor, _AND_ a 10:1 speed reduction emulating the computer. The Amiga AMAX program, only emulating the Macintosh since the 68000 is taken care of, actually operates about 20% faster than a Macintosh running at the same clockspeed, +/- 10%.

Why?

1407. Das_Omen and 1200xl's

>operates about 20% faster than a Macintosh running at the same clockspeed,
>+/- 10%.
>why?

Because Spectre and Amax are NOT emulators! There is no opcode-by-opcode
interpretation needed! Just a matter of loading up the Macintosh ROM and
some system specific routines in a Mac-like memory map and then let the
machine run full speed! An ST running Mac software under Spectre is no
different than an ST running ST software under TOS. It simply IS a Mac.

>operates about 20% faster than a Macintosh running at the same clockspeed

Hmmm.. I believe that this difference WAS due to clockspeed and only on
early Macs due to screen refresh. Now that this is handled by
special-purpose hardware, this remark is outdated.

> Why?

On the Mac (at least the Mac Plus) Apple decided to let the 68000 do everything, and didn't put in any custom chips to ease up the load on the CPU. Well, with the Classic, they redesigned a lot of the motherboard, eliminating chips and such, allowing it to run faster than a Plus. (I'm not sure, but I imagine that AMAX and Spectre (ST) don't run quite as fast as a Classic.) Anyway, the Amiga and the ST have other chips to help ease the load on the CPU, and I would imagine that the emulators take advantage of them.

>laughed at by other 8-bit users.

I appreciate your programming effort. I have always wanted an
emulator for the IBM. I don't like having to carry around two
computers, and the IBM has a much bigger storage capacity at a
lower cost. I am disappointed that your efforts have gone without
support. I would pay for such a program without hesitation.
As far as your problems with the O.S. couldn't you emulate the OS
directly instead of actually having a copy. I mean write the OS
in native 8086 and simply interupt execution of 6502 code whenever
an OS routine is called? Or/and maybe have the user supply the
OS. The 800 translator would work just fine for many programs!

> from a 1.79mHz 6502 no faster, even though it has a 16mHz 16/32bit

I think your missing the point. I have an atari and an IBM clone.
I am short on space, and I live at a university campus, meaning I
take only what I need. Having two computers is a pain. It is nice
to be able to turn on one machine and run ANY program you like. I
already have 2 apple emulators, a CP/M emulator, and a nasty Amiga
emulator. But I really like some of those good ol' atari games.
Having another monitor and keyboard is a pain. Also, the IBM
has a much larger capacity. I know of the SIO2PC, but that means
two computers, both running at the same time.
You seem to express conflicting opinions. You say that
the code should be converted to 8086. But this would mean MANY
compatibility problems. A problem that you also complain about.
Besides, it runs at the same speed of an atari. Any faster would
mean games would be unplayable.
You may think it is silly to use a $1500 computer to emulate a $60
one. And maybe it is. But, for me and many others, this is the only
alternate way that we are willing to still use our old atari software.
And finally you say that no emulator can run without quirks. Well,
I say no atari can run without quirks, period. Compatibiliy between
A ROMS, old 800, XL, XE, rambo, etc. are many in number. We live.
I am sure that I could live with 90% compatiblity without a wimper.
I've done it before.

Okay, you have a point. I didn't think the Atari 8 bit emulator emulated graphics very well, so had mentally discarded someone wanting to play games using an Atari emulator. Which left mainly applications and Atari type utilities. Obviously, anyone using a 386 in all probability wouldn't use Textpro when he could just as easily boot Wordperfect or a Windows application. That is where my logic about emulating the 8 bit came from. If the 8 bit emulator could successfully emulate all the fancy graphics, which Darek seems to indicate would be possible on an IBM Compatible, then my argument DOES FALL APART. As an extra note, my friend played all his Infocom Games on his ST using the XFORMER program. Really enjoyed it that way too.

I too go to a university, and married housing doesn't have much more room than a dorm. At least not for me, becuase my computer needs to be in the bedroom or the two year old daughter would murder the poor thing. I can see where I could benefit from having an ST/TT with a MAC emulator and IBM emulator running, maybe UNIX too if/when it arrives. The campus has all of the above computers available to the student.

> You seem to express conflicting opinions. You say that
>the code should be converted to 8086. But this would mean MANY

Not really, since the emulator has to translate the 6502 code into
something the 8086 can understand anyway, why do it on the fly? Why
not do it ONCE and be done with it, except for self modifying code
of course. I guess that is the tricky part.

Regarding the speed problem, I understand there are some IBM games that
don't run properly on high speed IBM clones either. Suppose you
did want to run an Atari application though, like Textpro. Wouldn't
it be nice to have it run three times as fast? I think so.

> You may think it is silly to use a $1500 computer to emulate a $60
>one. And maybe it is. But, for me and many others, this is the only
>alternate way that we are willing to still use our old atari software.

>A ROMS, old 800, XL, XE, rambo, etc. are many in number. We live.
>I am sure that I could live with 90% compatiblity without a wimper.
>I've done it before.

No computer runs without quirks. The MACS in the Math Dept. where I
am a workstudy student have all kinds of problems. IBM's got lots
of idiosyncracies (bad sp.), as do all computers. Look at the Atari ST
its compatability problems between OS/TOS revisions, and between the ST
and the TT. You can't pick on the Atari 8 bit alone.
There wouldn't have been compatibility problems
if the programmers had just followed the rules Atari set up, instead
of accessing parts of the OS which ended up being moved, although
their vectors were left in tact.

I think I already said that emulators aren't bad. They are just not
perfect that is all. I am not really bitching about it, just making an
observation. I stated that anyone purchasing an emulator expecting it
to run 100% of the software will be disappointed. This is true is it
not? In general, I think emulators are the best thing since sliced
bread. They can certainly help bridge gaps left by the different
platforms produced by IBM, Apple, Atari, etc. If you want to play
Atari games on your IBM, I sure wish you could. I think it is really
stupid that even though Atari officially kicked us 8 bitters out the
door, they still refuse to give Darek a break on the operating system
rights. I am not one to regularly bash Atari, but this move was
foolishness.

Regards,
Jeff

To all who don't know.. to get the index, send this message to
atari@atari.archive.umich.edu (let me find it, now!!!)

send 8bit/index

I believe.. someone correct me if I'm wrong, because I did this a
while ago... been buzy with TONS of other stuff...

1423. Another batch of PD at the archive!

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-26 10:53:55 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar26.105355.26638@aber.ac.uk>
Source record: 111767

I have just put some more of my PD at the archive. They are all in new at the moment, and are called: digidemos2_s1.dcm and digidemos2_s2.dcm (a DS/SD disk containing 4 digitized music demos), deansdesktop.arc (a little desktop style thing written in turbo-basic), pst.arc (Programmers Speech Tool allows you to add any of the 14 voice files on the disk to your own programs), thisnthat1.arc (a collection of some of my early software. Contains graphics demos, music, utils, games, and bits of everything really!). BTW, the desktop disk should not be write protected, because it write to the disk when you set the clock.

Tomorrow I will put some more PD up there. If I get the time, these should be: DSIL, digidemos 1, Education Disk 1 (with speech!), thisnthat 2, megablast 128k. It takes so long for you to get news from here that by the time you read this I will have probably already put them in the archive!

[...]
One thing I have always been mystified about though, is why translate the code from 6502 to 68000 or 80386SX on the fly? Why not do it ONCE and then run the code as a native processor program? Then only the Hardware emulator would be running, wasting time, not the translator emulator program.

No, you miss the point. Most emulators don't translate the code of the emulated processor to that of the native one, they implement a simulation, in software, of what the emulated processor does in hardware. In many cases it's difficult, if not impossible, to actually translate the bits in a non-trivial program, because the details of operation of the processor. Consider a trivial case; vaxen vs 68000s. Both have 16 registers, but the vax has 16 general registers, whereas the 68K has 8 data and 8 address. You can't build a translator that simply maps the 68K registers to the vax registers, because even though there are the same number of them, they don't do the same things. You of course have worse problems trying to translate code that knows things about, for instance, wierdo banked-memory schemes. And things such as the Atari 8-bits, which have lots of funny addresses which cause wierd effects when accessed, force you to do lots of special casing whenever you access any address that can't be computed at translate time. And I won't even mention things like pc-relative addressing, or self-modifying code. The upshot of all this is that at the absolute best, the generated code will expand by a large amount, and at worst, it may simply not be feasible to generate code that "does the same thing".

That's why they're called emulators, not code translators.

1426. Re: Das_Omen and 1200xl's

Newsgroup: comp.sys.atari.8bit

Message-ID: <1992Mar26.222818.17608@usenet.ins.cwru.edu>
Source record: 111770

Here's what you should try, if you haven't already.

If I think you're at the point that you are, on the screen you see:

[A] Das_Omen

and that is all, if that is true, then go ahead and hit the 'A' key.
It should load from there. I know other people have been stuck at that
point; if you got past that and it doesn't work, then I dunno what to tell
you, perhaps try the translator on it.

Yes... the ApacView 2.2 ARC is corrupted (thought I might be the only one), but ONLY the .DOCs don't work. What you should do is use (if you're using SuperUnARC 2.4 or something of that sort) the "extract w/ querey" mode (under [P]arams.. use the arrow keys to highlight the selections up top). Then it will ask you "Dirs [1]-[9], Extract this file?" or something like that. Select [N]o for the .DOCs, and [Y]es for everything else. Or maybe get however much of the .DOCs out first, then skip everything up to them with "w/Querey" on so you can get the files after it, because they're ok. Actually, Jeff, why haven't you uploaded 2.3 to the archive? I might if you don't want to. Also, what's up with 2.4? Still in developmental stages?? Thanks! Bill

Hope I helped!! Bill///

AARRGGGHH! Soap Box Attack! Jeff, you shouldn't back down so easily. Not to try to get anmybody P.O.'ed, but I can think of a few cases where the chip set in the 8 bit helps it perform faster then an emulator. For example: You've got a GR.(0) screen stored as screen bytes. To move them to the screen the 6502 only has to move 960 bytes Antic takes care of the rest. For an ST to do the same thing it's got to modify the entire 32k of screen memory. How about even a simple non-hardware scroll? Same story! ST is a great machine, but you'll notice a lot of programs just use the standard print routines & it seems to take forever for a menu to print out vs the way you can pop one up with a simple Moveblock routine, I assume they have to do it this way to save 30k for very help screen. When you get your Action! cart, scroll through a few screens (or do it with Speed Script) then use anybody's ST with ST writer & you'll see the dif. No joke, I wish my ST had an ANTIC in it (albiet 80 column one). It would blow the doors off any bit map screen display computer for certain app(s) like WP, modeming, etc.

Source record: 111777

For sale:
Atari 1200XL
Atari 1050 Drive
300 baud modem with software (plugs in joystick port)
Software including:
M.U.L.E., The Pawn, One on One, AtariWriter, Pinball Construction
Set, Racing Construction Set, Seven Cities of Gold, Music
Construction Set...
some public domain including my Video Sketchpad XIII (nice, but I
never got around to writing docs, but it is easy to figure out),
my Triple Yahtzee (not to brag, but it's nicer than ANY Yahtzee
simulation I've seen for ANY computer and no it's not on the
Michigian archive, but if you ask I might put it there), Football,
much much more (some stuff I typed from Compute!@, etc.).

Atari 2600 (the one with the switches on the front)
about 30-40 games (ask for list, includes many popular titles)
Nice storage container (holds machine, games, and joysticks, paddles,
driving controllers)

Make me an offer! I don't know the current going rates, but I'll find
out.

Well, a couple of points. First point: I was mostly joking.

Second point: When you say "emulate those guys", do you mean *realtime*
emulation? If so, then my respect for your abilities goes up to
stratospheric heights (seriously!). I wouldn't have believed that
it was *possible* to emulate fully functional DLI's, character set
graphics in several resolutions, GTIA modes, or audio stuff on a
standard PC platform of *any* type.

Mike Farren - no longer employed by Commodore. Still only my opinions,
and not those of any organization.

1435. Atari Mega ST4 For Sale CHEAP

Source record: 111779

Atari Mega ST4: TOS 1.2, in excellent condition. Works great. The 68000 is socketed, so it's ready for an easy expansion to an accelerator, or other mods. Asking $450 or make offer.

If interested, please leave me mail here, or call me voice at 804-971-6919. Please leave a message on my machine if I'm not around. Thanks!

Rob

1436. A BIG batch of PD at the archive!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-27 16:55:56 UTC
From: djg0@aber.ac.uk
Message-ID: <1992Mar27.165556.3623@aber.ac.uk>
Source record: 111780

As promised in my last posting, I have uploaded a load of PD up to the archive.
The full list of today's postings is as follows:

atomit.dcm - Great game! Got to build molecules out of bits in a limited time.
Ignore the other file "atomit". That was a screw up on my part!!
Density: single.
Boot 1 without Basic.

digidemos1_s1.dcm and digidemos1_s2.dcm - Digitized music demos disk 1.
Density:single (double sided).
Boot 1 and 2 with Basic.

dsil_s1.dcm and dsil_s2.dcm - Digital Sounds Instruction Langauge (DSIL).
A very simple digitized sounds manipulator.
Density:enhanced (double_sided).

Boot 1 and 2 with Basic.

education1.dcm - Education disk 1 (counting and maths). This was a project I
initially worked on in 1986. Software speech was added later.
Density:single. Boot 1 with Basic.

bingames.dcm - A collection of binary games. Docs. on disk are in French!
Density:single. Boot 1 without Basic.

mblastdemoXE.dcm - Megablast digitized music demo. Requires 128K or more to
run.
Density:double. Boot 1 with Basic.

menudisk.dcm - "Howfen Menu" disk with disk-disk tape-disk transfers a lots
more!
Density:single. Boot 1 without Basic.

secsurgeon.dcm - Sector surgeon - a nice sector editor/fixer.
Density:single. Boot 1 without Basic.

thisnthat2.dcm - This n that disk 2. More early efforts from me. Includes more
graphics demos, and other stuff.
Density:single. Boot 1 with Basic.

Make sure you format your disk with DOS 2.5 in the densities shown before
using diskcomm.

I still have about 200 more sides of atari disks to post up to the archive!
I will slowly do this when I get back from my easter holiday in 4 weeks time.

As I mentioned the other day, I will have no email or news access during my 4
weeks off. However, my home address is:

DEAN GARRAGHTY
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

phone: +0302855026.

Don't forget: Digi-Studio PACKAGE 1.5 will be available very soon. This package contains new extra programs forming part of the Digi-Studio suite. This is NOT just a new version of Digi-Studio! Package 1 will still be available.

Package 1 contains the keyboard player, tune player, 29 samples, 5 tunes.

Package 1.5 contains: Sample editor/creator, tune compiler (allows you to add Digi-Studio tunes to your own Basic programs), 15 tunes, and 20+ new samples.

Cost: Package 1 alone - 10pounds UK sterling for US orders (5pounds UK orders)
Package 1 and 1.5 pack - 13pounds UK sterling for US orders
(8 pounds UK orders).

Package 1.5 is no use on its own, so will only be sold with package 1, or separately to people who have alreday bought package 1 (this doesn't apply to any US people, because I still haven't sold a single copy to a US person!).

Have fun! See you all in 4 weeks!!

Dean Garraghty.

1437. Re: A BIG batch of PD at the archive!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-27 17:01:58 UTC

>slower. It has NOTHING to do with the custom chips like ANTIC or POKEY.

Mike is right, it's no easy task. Of course the 6502 isn't comparable to a 368.
But the 8-bit Atari is not just a 6502 . It is the combination of all the
chips POKEY, ANTIC (a co-processor!), C/GTIA (and PIA).

Consider a switch of character sets.
On the 8-bit you just do LDA #>Newbase STA CHBASE, and ANTIC does it for
you. On a bitmapped screen like the ST or the PC, your gonna redraw a lot
(if your doing Display Lists properly (which you should), not only once
but every VBI).

Now you also got to tangle with P/M and possibly fine scrolling at the same
time (not forgetting DLIs). Even a 486 will croak on this.

>Emulation of those guys takes up less than 5% of the processor time.
I would't call what you are doing emulation, its more like a crutch for the
software to work in your 6502 enviroment..

Sure, application programs may run a dozen times faster on a 486, but
can you play your cool games on it ? I am not saying that a 'limited' emulator
hasn't its purposes, but I don't see it a feasible hardware replacement (yet).

And as not to come off negative, I think that the Xformer (I am a registered
user) is nevertheless a formidable effort.

Nat!

From my understanding, DOS 4 was commissioned by Atari sometime after they finished 3 (which bombed). According to the account I heard they spent A LOT of dough on it, and then never released it, letting the author keep it, who then released it to PD. Supposed to have tonnes of help screens, use recognize diff. densities, etc. I've never used it, though, so I really don't know.

Sorry, I can't email Todd sans bounce (like your congressperson's checks). Todd, I may get the schematics we spoke of earlier, from the source you mentioned.... do you still want to see them?? I get your email to me, but we can't seem to deliver it the other way.... j harris/fairbanks

1442. Power supply problem.

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-28 01:00:25 UTC
From: a644690c@edinboro.edu
Message-ID: <00958399D4C67AA0.20209D43@edinboro.edu>
Source record: 111786

This is for all you fellow hardware hackers out there....

I think the power supply for my 800xl may be bad, but I'm not sure.
When my entire system is cold and I power it up, I get a fairly loud
hum from my monitor speaker and several distinct, slowly scrolling, horizontal
bars of distortion on the screen. When everything warms up, It stops.
I know it is rare to have a 'cold only' thermal problem, but its there.
I was thinking it may be the voltage regulator simply producing a low
voltage until it gets warm and produces the proper resistance, but the
hum and bars make me think it may be the filter capacitor or rectifiers.
Has anyone ever experienced this type of problem and/or fixed it?

Oh, Someone mentioned problems with there 1050 reading.... I recently
had a 1050 go bad as well. It had a US doubler and would not work
properly in DD. It actually had two problems (I got it used). One was
the doubler chip had a solder contact come loose and it would time out
a lot. It finally quit all together and I discovered it was the stepper
motor. Luckily I had another mechanism with a good stepper motor but a
bad drive motor. I just swapped drive motors and placed the, now good,
mechanism back into the 1050 and it worked perfectly. I don't know
if any of that helps but rambling about Disk Drives is a lot more fun
that working on the COBOL program that I should be at the moment :-).

Peace,
-Adam Conover.

> should be able to tel you.
>
(BTW: you're not a famous writer, are you Henry?)

Anyhow... the paddles!? In BASIC, the function PADDLE(x) returns a
value between 0 and 228 for the position of paddle #x. (x goes:
0 - port 1, paddle 1
1 - port 1, paddle 2
2 - port 2, paddle 1
3 - port 2, paddle 2
if you have a 400 or 800 (4 port system), just keep going)

In ML, etc., the memory location is 624, I believe (for PADDLE(0))..
check some books (with memory maps). (I'm not hope right now, so I can't
look it up... sorry!) Hope you guys figure it out!!

In my OWN humble opinions, Atari's worst failings where the classic
8-bits were concerned was the absence of a useful 80-column driver
in it's first few years of existence. Certainly the XL series should
have been 80-col capable, the XE series was nothing less than absolute
BLUNDER.

Message-ID: <9203290441.AA20879@smithkline.com>
Source record: 111795

<<<<<<<<<<<<<<<<<<<< 6502 PROGRAMMING OPPORTUNITY >>>>>>>>>>>>>>>>>>>>

I was recently informed that Bob Puff of Computer Software Services in Rochester, New York is looking for a *competent & dependable* 6502 M/L programmer. Pay would be in the form of royalties based on sales of your work thru CSS.

This is serious stuff. CSS is one of the last major 8-bit developers left in the market. If you have ever used BOBTERM, SUPERARC/UNARC, or used any major CSS products such as the Black Box, Archiver, or 3.5" floppy upgrades, you have an idea of the impeccable style crafted into Bob Puff's products & the high standards he has established for CSS since he took over the operation of the company last year.

If you think you're good enough to crunch code for Bob Puff, contact him at:

Computer Software Services
P.O. Box 17660
Rochester, NY 14617

voice: 716-429-5639
FAX : 716-247-7158
BBS : 716-247-7157

If this opportunity interests you, be aware CSS is looking for someone with the following qualifications:

1.) You MUST have your 6502 down cold, be able to code *concisely*;
2.) You MUST be a dependable/reliable/responsible individual who can deliver quality work on time.

Bob didn't go into detail on this, but I rather suspect he would be most favorably impressed with someone who could furnish examples of their coding expertise & provide references to vouch for their dependability.

If ever there were an opportunity to make a little money for yourself, support CSS & the 8bit community, & dazzle your 8bit friends by telling them you work with Bob Puff, this has to be IT.

SERIOUS INQUIRIES ONLY, PLEASE!

[NOTE: Don't contact me, contact CSS directly at the address above.]

1452. Re: how do you read the trackball and touch tablet?

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-29 08:28:41 UTC
From: rkim@MARS.CALSTATELA.EDU
Message-ID: <9203290828.AA17911@mars.calstatela.edu>
Source record: 111796

Richard Ho asked if there were documentation on programming the Atari
Trackball and Touch Tablet.

The Atari Trackball model CX-22 had a switch setting on the bottom:
Joystick and Trackball modes

On the Joystick setting, the trackball gives out signals just like a
regular joystick. On the Trackball setting, it gives a different
set of signals: X and Y directions, X and Y speed rates.

All of this is documented in a short essay written by William Bartlett
entitled "Programming the CX-22 Trackball". In it is a brief discussion
of trackball theory, coding strategies, and a couple of BASIC and
assembly code demos. This was sent to me by the old, old Atari Corp.

Yes, I have this info. Unfortunately, I don
't have it with me right now...have to search for it... :(

If there is a big demand, I will post it as it's only 6-8 pages long.

Later,
Rich K.

I made this suggestion about a year ago to both Chuck and Darek. Neither seemed particularly excited about the idea. At the time, Chuck was working on an 8bit emulation CARD for the PC, so I didn't really care if we had a software emulator all that much, but now that the card idea appears to be dead, I wish someone would get a software emulator running.

What do you think would happen if we got a bit of a campaign going to have Atari release the stupid ROM code into the public domain for the purpose of "keeping us poor 8bit saps happy"??? Naw, Atari is probably afraid we'd start modifying 8bits to be more powerful that their ST line...

The 1450XLD was never produced by Atari except as a prototype. It was a
new computer in the XL line, and included such things as a built-in 1050
drive, a built-in modem, speech synthesizer, etc. I have never seen
one, but I have seen a 1400XL, (also never produced) which has
everything except the disk drive. I assume that DOS 3.0 was made for
the 1050 drive as part of the 1450XLD, was then used for the 1050 by
itself, and then ended up going the way of the dinos because it wasn't
compatible.

I have a few Atari 8-bit items for sale, if anyone is interested.

Software: $15 each OBO
1) Fooblitzky
2) Witness
3) Cutthroats
4) The Pawn
5) Flight Simulator II
6) E-Factor
7) Caverns of Khafka
8) Carina BBS
9) Carina II BBS
10) Atari Protection Techniques
11) Advanced Atari Protection Techniques
12) Brimstone
13) Enchanter
14) Ultima 4
15) Basic Turbocharger
16) Sparta Dos Construction Kit

Cartridges: $10 each OBO
1) Centipede
2) Basic XE
3) Wizard of Wor
4) Eastern Front

Books: $10 each OBO
1) Compute's Second Book of Atari
2) Mapping the Atari
3) Adventures with Atari

Hardware:
1) Parot II - $30 OBO
2) Supra 2400 modem - $50 OBO
3) Atari 800XL with 256k Rambo - $100 OBO
4) Atari SMM 804 printer - $50 OBO

Well, that's about all of it, except for 50+ disks filled with files
and digitized pictures and digitized sound and the like. I'll sell all
misc. discs for $100 OBO....

Yep! I mean, what exactly is the point of the XEP80 and the useless COL80HND.COM I have? It's pointless. I must admit the .COM file runs fairly fast for what it does, but it's SOFTWARE. SOFTWARE STINKS! (I should talk! I don't even TOUCH hardware!! God... I live in BASIC.. how pitiful! :)) The prob. with software handlers is the fact that they can be so EASILY overwritten!!! Also, from what I've heard of the XEP80, all it is is a h/w version of this software routine I've come upon. The thing that ticks me the most with it tho, is the [ESC] sequences are ALWAYS on, except for [DEL] and [CLEAR]!!! It STINKS! I think they (someone) should make a hardware upgrade or something close to the XEP80 that emulates the "E:"ditor FULLY, AND also lets you POKE TO THE SCREEN! Now THAT would be nice! LOCATEing would be a snap, and EVERYTHING would be handled by the upgrade. OR.. how about a 2k (rather than 8k in 80col or 1k in 40col) 80col screen. Have 1/2s of character sets and then flip between two screens and two character sets (or even just scroll 1/2 character). Hmm... some expert on VBIs and the sort had better take over from here! :) Hmm.. I feel I've actually come up with a GOOD IDEA!! (it's been weeks now! :( ) hmm

1460. Ataris in Europe

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-30 04:16:13 UTC
From: trag@pnet01.cts.com
Message-ID: <1992Mar30.041613.17819@crash.cts.com>
Source record: 111804

Greetings from San Diego, Calif.,

I'm doing a story on Amiga and Atari computers' market share outside the United States; specifically in Europe. I'm interested in observations, opinions, facts, figures and just plain ruminations from Atari/Amiga users in Europe. As a U.S. user, I'm unfamiliar with the set-ups of the Atari and Amiga computers sold in Europe, particularly as we hear that both machines are popular due to their Unix capabilities. Any information on non-icon desktop OSs on Amiga and Atari is greatly appreciated. Also, we in the U.S. hear that Ataris and Amigas are vastly more influential on the overall European computer scene than is true in our country. Again, any comments reflecting the accuracy/inaccuracy are appreciated.

The story will run in San Diego's ComputorEdge magazine in mid-May, and I will e-mail an ASCII copy of it to all who respond (as well as the general conversation groups, if an interest is noted.)

If those in Japan, Latin America and Australia/New Zealand wish to respond as well, it would make an interesting sidenote to the situation in Europe. Too, C-64 and Atari 400/800/XL/XE users familiar with the role of those computers in their home countries should also respond if so inclined. All information on Atari and Commodore products is welcomed, and all responses will be likewise responded to.

Please e-mail all responses to the above address, and many, many thanks for your help, cooperation and loyalty to non-IBM platforms.

Date: 1992-03-30 06:36:16 UTC
From: mfrank@nmt.edu
Message-ID: <1992Mar30.063616.23167@nmt.edu>
Source record: 111706

I recall reading on two occasions of the impending close of
atari.archive.umich.edu--or at least the 8bit atari part.
Would it be possible to persuade the people who work at
wuarchive.wustl.edu or perhaps wsmr-simtel20.army.mil to take over
that service?

This space intentionally left blank.

> drive to do the copying...

I would like to know where I can get a copy of UTIL.EXE (or how to get it
from the atari archive). I have tried ATARIO without success. I could not
get it to even read the directory of an atari DD disk that was written
with an Indus GT drive. It had been formatted using SpartaDOS 3.2d. I tried
an MS-DOS machine using both a standard density drive and a high density with
the same results on both. I would like to try the UTIL.EXE.

Thanks...

wuarchive.wustl.edu just started mirroring the umich archives,
including the atari 8bit stuff. Of course, if umich shuts
down, they wouldn't have anything to mirror. If I recall
correctly, the atari part of umich is going to continue.
BTW, the atari stuff is in mirrors/archive.umich.edu/atari/8bit
on wuarchive, or something like that.

Don't know if they would handle it directly.

1465. RE: Power Supply Problem

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-30 15:57:19 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9203301557.AA26772@smithkline.com>
Source record: 111709

I read with interest Adam Conover's description of his "cold only" power supply problem.
The fact that the problem gradually clears up after awile indicates that his regulator & diodes are OK. The culprit is the large electrolytic filter cap (typically 10,000uF or 6800uF). Adam doesn't say which type supply he has (I named them Type I,II,II,& IV in my power supply article in the Nov. 1990 issue of Current Notes. whoops- that's I,II,III & IV I mean.)
My guess is that most likely Adam has a type I (white case) or a type III (black case but same size/shape as the type I). If so, the unit is a snap to repair, Best should be able to supply the cap. If the supply is a Type II (black, totally sealed in @#$%&!!! potting compound, alias "The Klunker" or "The Brick"), forget about repair & buy a new one.
Adam's XL is likely 7-8 years old & has seen heavy use. The heavy current drain, high internal temperatures, & hundreds of on-off cycles are borne most heavily by the big cap. Eventually they either vent their juices &/or dry out. This lowers the effective capacitance & increases the unit's internal impedance. When that happens, unacceptable levels of 60- or 120-Hz AC ("ripple") appear on top of the +5V, reproduced as audible hum on the audio output & classic "hum bars" on the video display. Hum bars typically appear as thick dark horizontal bands that migrate slowly up the screen.
This already happened to one of my five 800XL's, I repaired it (it was a type III supply).
Sooner or later this problem will happen to virtually every XL ever made, especially if the machine is left on a lot &/or you have hung a bunch of extra power-hungry goodies onto it. A souped-up XL should have a beefed-up supply such as the Squeezed Queen I described in the Nov.-Dec. 1991 issues of Current Notes.

I have a slideshow disk with technicolor dream pics on it from Red Rat. I assume for promo purposes. The disk came with and ran under spartaDOS, so I'd think that was what TD itself ran under. Then again I have never used the program so I cannot be sure.

I agree. An IBM platform doing an 8-bit!? THAT HAS GOT TO BE HARD!!!
Too bad those lil #@!$&?*'s over at Atari won't just release or at LEAST
sell the rights to those damned chips to someone and then that company
could make something like the XEC130. I suppose BEST or someone with
plenty o' parts could sell a package of the XEC130 with the GTIA, etc.,
included. I could easily see a motherboard of an 8-bit jammed into a
card slot of an IBM and running fairly well.. Bill

Woa Bill. The XEP80 is hardware. There is a special display chip in
the XEP80 that outputs a VERY NICE 80 column screen, much better than
any Graphics 8 rendition of 80 columns will ever approach. The reason
it is slow is because there is only ONE WIRE going from the
joystick port to the XEP80 on which all data is sent. I agree about the
80 column handler program though, it is too volatile and touchy, doesn't
work with everything. You could get someone to write a ROM version I
suppose, say something in a Paralle Bus chip.

Dataque Software WAS developing an 80 column card that did just what
you asked. Plugged into the parallel bus, the driver was in ROM,
and you could poke to memory. Nice output too. Write him and ask
what happened, maybe if he gets enough replies he will finish
development and put it out on the market. I saw it at a show, and
almost bought a betaversion.

Dataque Software
P.O. Box 134

Ontario, OH 44862

Oh, one thing I must mention, programs expecting 40 column screen will
still look wrong if they try poking to memory. Why? there are now
80 bytes per line, instead of 40. Do the math, you see that two
40 column lines if they are poked, will end up on one line in 80
column mode. So it still doesn't look right. What programs do this?
Part of SD-X does, and also Flashback! There are others!

I THINK this is one of the main reasons Dataque didn't release the
80 column card, there just isn't an easy way around this problem.

I don'T want to start compute wars, and this proboly should go elsewhere, but I ca'T be sure you will see it.

First on the IBMs windows is slow in the fastest speed. Also there are many terms, Try Amodem version 1, or something like that on the atari, and compare to bobterm. Your Atari is good enough, unless you need to work on IBM files.
Since to know what to use and what not to use takes time, stick with the Atari.

> >I have 2 1050 disk drives that fails to read. Has anyone had any success in
> >making repairs to these units? Is the SAMS manual useful?

I've had a similar problem with my 1050 drive some time ago.
The drive was OK but from time to time it failed to read. Finally
it wasn't able to read anymore, it even stuck while formatting.
The solution to this problem was very simple. The drive was simply
too fast! All you had to do was to moderate the tourning speed of
the drive. Opening the drive you can find a potentiometer which is
responsible for the speed of the drive, though it's hard to
explain with text where exactly you can find it. Perhaps you'll try.

From: a644690c@edinboro.edu
Message-ID: <009586236685A660.2080083C@edinboro.edu>
Source record: 111720

Hi,

Does anyone think that an unmodified XF551 drive could read a 360k MS-dos
format disk. I'm not to sure of the flexibility of the ROMs but I think
it could be done (maybe it already has and I'm just clueless, but....).
If anyone knows a bit about the XF drives, please let me know.

-Adam Conover.
a644690c@edinboro.edu.

P.s.
Oh, I mentioned by defunct power-supply the other day..... It
definitely was the filter capacitor. It was so hot, the plasic casing
of the capacitor was actually starting to melt. Luckly I have an older one
that can be repaired for about $.87.

Subj: Re: Power Supply Problem

[I am replying as I can't post for some reason...]

I just recently had my own power supply experience, which I will breifly relate:

I have two supplies: one $#!+ filled "brick" supply (came with my 800XL) and a rectanular black supply that is hollow and has XL-style vents (type III? IV?) (came with my 600XL) Tried to fix the brick (HAHA!), then the vented supply. The problem with the latter was that after heating up, the cap put in by Atari would back out of the board (really short leads) enough to change resistance. (?? I'm no EE, my best guess...) Dissasembling and re-soldering would fix it for a couple of weeks only. I went to Radio Shack and bought a new cap with longer leads and all is now well.

In article <9203301557.AA26772@smithkline.com> you write:
> Sooner or later this problem will happen to virtually every XL ever made,
>especially if the machine is left on a lot &/or you have hung a bunch of extra
>power-hungry goodies onto it. A souped-up XL should have a beefed-up supply
>such as the Squeezed Queen I described in the Nov.-Dec. 1991 issues of Current
>Notes.

I would be interested in reading these articles. How can I get ahold of them?

Thanks,

Duane Tribe (tribe@ted.cs.uidaho.edu)

1478. Power Supply Problem

Newsgroup: comp.sys.atari.8bit
Date: 1992-03-31 23:06:17 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9203312306.AA03815@smithkline.com>
Source record: 111722

Duane, back issues of CN are available for $2.50 ea. (1991) or $2.00 ea. for 1990 & 1989. I recommend to *EVERYONE* to purchase as many back issues of ANY magazine that supported 8bits as you can afford. Magazines- old or current- are STILL the best source of info for our 8bits.

Contact CN:
(703)450-4761 business line, ask for Joyce Waters

Current Notes Inc.
122 N. Johnson Rd.
Sterling VA 22170

BTW, the situation you describe- where the cap kept pulling itself loose from the board- is also a sign of a defective cap. A cap that develops high internal impedance will tend to heat up when it is exposed to AC (such as the very high amount of ripple present at the output of the rectifier diodes). Electrolytics that get hot will tend to swell, or bulge (if they get hot enough fast enough, they blow up!). In your case the cap pulled its leads loose when it swelled. Merely resoldering it back into place could provide at best only a temporary cure- as you found out! An ironclad rule is that capacitors should NEVER be hot! There are only 2 ways a cap can be hot: A.) it's defective & should be replaced; B.) it is situated too close to some heat-producing component & is absorbing that componet's heat via conduction thru a circuit board foil trace. The cure there is to add extra heatsinking to the hot component to reduce the thermal load on the cap. If allowed to continue, the hot component will eventually dry out the cap & destroy it.

The pwr supply you describe is a type III, they were mostly shipped w/600XL's but I got mine with an 800XL. The filter cap in the the type III is the cheapest piece of junk I ever saw, Atari mustah got a deal on them. The value of the cap in those supplies- 4700 or 6800uF, is I think too low to provide adequate hum filtering for an 800XL which draws more current than the 600XL. The voltage rating should be 25V minimum, higher is better.

An unmodified XF551 can't do it. It can only read 128-byte or 256-byte sectors, and MS-DOS uses 512 bytes per sector. CSS sells an upgrade that is supposed to be able to read MS-DOS disks. Has anyone on the net used this, or the Black Box with floppy interface? Inquiring minds want to know!

Hey! Guess what I saw earlier today!? A LYNX COMMERCIAL! And a NEW one at that! (At least to me, over here by San Francisco) It had some of the old scenes like the kid by the brick wall who gets all of the bullet-holes through him, and the 4 kids playing Gauntlet. But they also showed pics (enhanced of course) of some games I've never seen (I'm inthe dark tho. I've HEARD of most of them, but not actually fiddled with them) like Ninja Gai-den and stuff. WAY COOL! :) I wish Nintendo would just give up on their little GameBoy peice of trash. How can one compare 4 colors to 4096!?

Sorta like CrApple// or Timex Sinclair to a SVGA IBM or Amiga or TT or something!!!! hehe >>ATARI SPENDS MONEY USEFULLY FOR ONCE IN A BLUE-MOON!<< happy... sort of.. Bill

1483. comp.sys.atari.8bit Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-03 03:18:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <01GIDWTXJI4090N61B@carleton.edu>
Source record: 111727

Frequently-Asked Questions

comp.sys.atari.8bit

Revised 2-Apr-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is this Usenet newsgroup, dedicated to the free exchange of information pertaining to the 8-bit Atari computers: the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st. Users of Atari Portfolio computers refer to comp.sys.palmtops. Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest consists of postings to comp.sys.atari.8bit, collected and e-mailed to subscribers on the Internet who do not have access to Usenet. To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to Info-Atari8-Request@naucse.cse.nau.edu.
Cross-posting from the Info-Atari8 Digest to comp.sys.atari.8bit is not implemented at this time. Thus, one should NOT post to Info-Atari8@naucse.cse.nau.edu. Rather, one should send his/her posting to comp-sys-atari-8bit@ucbvax.berkeley.edu to ensure that the message will appear on comp.sys.atari.8bit.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning, jrd@stony-brook.scrc.symbolics.com.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/Index

BART automatically UUEncodes binary files before sending them to you.
Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragaph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.164.8), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/new". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to jrd@stony-brook.scrc.symbolics.com. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file at the top of the message so he knows what directory to place it in at the archive.
3. If you can neither FTP to the archive nor e-mail to John Dunning, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International 8-Bit Atari Online Magazine, published bi-weekly. It covers the 8-bit Atari computers exclusively.
Z*Mag is NOT the same thing as Z*Net, though they are published by some of the same people.
To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Goz' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net Atari SIG is like a huge public bulletin board system. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.{82,75,76}). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG members-list are automatically members of the official Atari users' group CAIN - Central Atari Information Network.
CAIN carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers.

Are there any magazines still supporting the 8-bit Atari?
There are several:

Atari Explorer Atari Interface

&21.00/6 issues air tmailuk/c=gb/@sprint.com

Are there any product developers or vendors still supporting the 8-bit Atari?
Ben Poehland has created quite a long list of firms devoted to the 8-bit Atari market. This file is called vendlist.arc in the /atari/8bit directory of the atari.archive.
Ray Wilmott maintains a similar list. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are given the extension .uue.

Can I read/write 8-bit Atari disks on an IBM-PC?
Yes! There are three files at atari.archive that claim to do this. They are: atario21.arc, pcxfer.arc, and util.arc. Each of these programs runs on

an MS-DOS type of computer. For disks written on your PC to be read on your 8-bit Atari, you must have an Atari disk drive capable of accessing at least 180K, SS/DD disks. That is, an XF551, Indus GT or equivalents, but not an unmodified 1050 or 810. There is no way to write 128K or 90K Atari-format disks with an IBM-PC. You will also need either SpartaDOS or MYDOS on the Atari.

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is an extension of Atari DOS 2.0S/2.5 that provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon. It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

1484. Cleveland Free-Net Atari SIG

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-03 05:33:49 UTC
From: zdenekjs@NeXTwork.Rose-Hulman.Edu
Message-ID: <1992Apr3.053349.19679@cs.rose-hulman.edu>
Source record: 111728

How do I access the Cleveland Free-Net Atari SIG ???
when I telnet to it, I get the following:

Connected to 129.22.8.82.
Escape character is '^]'.

CWRU INS 4.3 BSD (cwns16) (ttyp4)

Password:
Login incorrect
Login: go atari
Password:
Login incorrect

Is there a special login name that I should be using??
The FAQ list didn't help.

Thanks
Jerry Zdenek

1485. WANTED: : ATARI 800XL ::WANTED

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-03 06:09:38 UTC
From: experts@teal.csn.org
Message-ID: <1992Apr3.060938.29394@csn.org>
Source record: 111729

WANTED::

Atari 800XL with drive(s) and (extras??).

I don't remember the next model--130something--would also work.

Birthday present for my 9 year old son - 13 year old already has some
software and games for Atari.

Nice if extra software is included - nice if printer (even the original
Atari type) is included.

E-mail WITH PRICE and what is included to: experts@csn.org

Thanks.

If you happen to need one, I have an internal 2400 baud modem
(Hayes compatable) for IBM PC for partial trade - works great, my employer
provided me with another model.

This is intersting. You're on a NeXT, I gather? I have seen the same thing
when connecting to the Free-Net directly from a NeXT. What's happening is
it's skipping over the first menu choice where it asks you if you're a
visitor or already have an account. I get around the problem by telnetting
to the local VAX/VMS system before telnetting to Free-Net.

Does this make sense to you?

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <56821@cup.portal.com>
Source record: 111733

BTW: Bob Wooley did add an 80 column chip. I can't recall just exactly what newsletter(s) the project was in, but I believe he piggy-backed a 6545 VDI and some ram onto the GTIA. REAL foggy on this, but I believe he asked for someone who'd do the programming for a handler, got a response, but I haven't heard anything since. It's another one of a long list of projects waiting on my work bench.

1490. Re: Percom drives hack

Newsgroup: comp.sys.atari.8bit

Message-ID: <56822@cup.portal.com>
Source record: 111734

Hmmm, just read the other response about some Percoms being single density.
=>SOL. Shot in the dark, but except for the XF551 Atari drives are supposed
to recognize the disk density when you 1st insert the disk. I've got my
MyDOS manual. For 5.25" disk 0=6ms 1=12ms 2=20ms 3=30ms step rate/track.
Just saw a blurb in the manual that says, "The density used for most MYDOS
commands is determined by the data written on the diskette and the operator
need not worry about setting it. The 'P' command is provided to allow forcing
the density setting for the format ("I") command etc..." so a last stab.

Gee I almost had forgotten he had did that, I think I will email him
and ask him about it, see if anything came of it. As I recall, it
wasn't very easy to program though. I will let you all know what
he says.

Due to a couple of requests for Atari DOS 2.0S and 2.5 I ftped arc-ed, diskcomm-ed files of 2.0S, 2.5, and 4.0 to the archive. I also placed DOS XE in my account but did not ftp it since I wasn't sure if it was PD.

I wanted to send a description of the files to jrd but didn't know the rest of his address so I sent it to Info-Atari8@NAUCSE.CSE.NAU.EDU which appears in the "8-bit.text" file.

I uploaded the files late at night, the next morning jrd posted the following: "Does anybody know what's in the 3 files called DOS20S.ARC, DOS25.ARC, and DOS40.ARC which were recently uploaded to the 8bit section of the archives? Would whoever uploaded them please contact me? Thanks..."

So, I emailed the same description to jrd@STONY-BROOK.SRC.SYMBOLICS.COM. Mail to Info-Atari8 is apparently lost or ignored.

Later I ftped the archive and found that the DOSes had been deleted. I did find the file readme.txt in the "new" directory.

```
---- readme.txt ------------------------------------------------------------
If you're uploading things into this directory for inclusion in the
8-bit archives, please take the time to put together a brief description
of whatever you're uploading. Include it as a separate file, or stick
in a .ARC, or whatever, but please include it. Dumping random files
with random names simply encourages things to get lost or misfiled.
Thanks for your support.

-- The Management
------------------------------------------------------------------------------
```

Pet Peeve: I hate it when people use phony pseudonyms.

I don't know if anyone's noticed this but it is ironic that there are now a bunch of files sitting in the directory. Some documented, some not. But isn't that what ftp sites are all about, searching through files and files just to find a few jewels? (Debatable I admit. <-- This is a disclaimer. It is meant to avoid starting a string on the net.)

In the meantime Michael Current has posted that a PD house is selling DOS XE as public domain. Due to storage limitations I had to delete the files from my Purdue account. Therefore the several hours that went into diskcomming, arcing, and kermitting have been lost.

Insurmountable, evil forces are obviously at work here. Oh well, I tried. Sorry it didn't work.

```

You said perhaps an Amiga could handle the job of emulating an 8-bit.
Well of COURSE it could! :) Some of the same designers (from what I
know) worked on the graphics for both systems. Hence the funky sprites
and all of that. Also, what about the COPPER list of the Amiga. Isn't
that pretty close to a Display List? Or is it. Hmm..
Hey.. there are no Amiga emulators for IBMs, are there?
Sorta strange that almost every system can emulate an IBM...
but very few systems are emulated BY IBMs.. heheh... Bill

Can someone please send me detailed instructions on how to use the BART mailer for those of us who don't have ftp access?

Thanks,
Lawrence Estep

1496. RS232 on MIO bad?

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-04 05:47:24 UTC
From: AKH104@psuvm.psu.edu
Message-ID: <92095.004724AKH104@psuvm.psu.edu>
Source record: 111740

I have recently acquired a used 1meg MIO and everything appears to
work except the RS232 connector. Everything works perfect on my 850
but when the cables are switched to the mio and the mio setup changed
the machine locks up when doing a close. For example in basic..
if I open #1 as R1: and write data to it..all the while the little red
LED is lit..and then close R1: the machine locks...and the LED stays a
nice bright red. Anyone have this problem before?
Any help as to what to look for?
Andrew

1497. atario2.1 and util

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-04 06:18:25 UTC
From: AKH104@psuvm.psu.edu
Message-ID: <92095.011825AKH104@psuvm.psu.edu>
Source record: 111741

I just upload atario2.1 and util to the archive. For those of you IBMers out there. Util reads and writes mydos disks and atario reads mydos and ljk disks as well as xf551 double sides disk (So it says).
Andrew

I have a routine which reads a single-density (128 byte) Atari disk sector.
I'd like to alter it to read 256 byte double-density sectors, but I can't
seem to find documentation on this. Any help is appreciated.

>I wish Nintendo would
>just give up on their little GameBoy peice of trash. How can one compare
>4 colors to 4096!?

Well, I dont own a Lynx, but I do own a GameBoy. The only reason I
still keep my GameBoy is the size of it... Its nice and small, the
Lynx is big(ger)... But colour _would_ be nice! (and considering the
price of the Lynx, ~$90, its easily affordable).

BTW: I think the commercial was pretty neat. Speaking of Atari commercials,
tho. I have an old video tape of `The Hobbit` which I was watching the
other day. The copyright is 1977, but I think it was rerun in like 1985
or thereabouts. Anyways, one or more of the commercials was an Atari
ad for the 2600 game machine! (I do recall that for a short while
they tried to rekindle the market share they had for a while. just
MHO)

Well, I do happen to have a legal copy of the source code. HOWEVER,
that does not mean that I am licensed to use that source code in another
machine. Nor does it mean that I am able to make a copy of that source
code in any form, which turning it into object code WOULD be.

>Still, I can't see what possible use an 8-bit emulator would be. It couldn't

Yes, but there are folks like me around who have all the software ever
made for the Atari (well, most of it. <grin>) And don't want to give
that up. I use Macs at school, IBM's at other peoples houses, but I
still like my old 8-bit system. It gets the job done, and I know it
inside and out.

>was able to call/poll/whatever it from BASIC, and use it to control a
>drawing program...

I'm still here - I just haven't been able to post reliably since they
moved our offices and systems. Would you mind posting this for me?

Glad you got the trakball handler working. Since then, I modified it
to use the commodore mouse, which is what I use now for hacking. I
turned out to be a two-button chauvenist.

To the folks who are beta-testing command-line mydos: Get your
comments to me. I would like to get bugs fixed (and minor additions)
in and get it posted. I use it exclusively now, and would like to
share my good fortune.

BTW, I like it so much I would like to sell my copy of disk-based
SpartaDOS (and my US doubled 1050 with it, since I have converted to
XF551). I also have an unmodified 1050 and 65XE for sale (since I got
a 130XE).

Also - to the war on the XEP80 - The editor I wrote for it exploits its burst mode, which speeds it up a lot. I also use its 25th line for commands and status, so you get to see 24 lines of text. I find this handy too.

One final request - I am doing a project on the wife's PC. I need to r/w 3 1/2 disks in a different format than native PC, and need some help. Anyone out there with knowledge please contact me - I'd like to get this done so I can go back to programming my REAL computer!

-Stan

1502. Re: atario2.1 and util

In a previous article, AKH104@psuvm.psu.edu () says:

> I just upload atario2.1 and util to the archive. For those of you IBMers
>out there. Util reads and writes mydos disks and atario reads mydos and ljk
>disks as well as xf551 double sides disk (So it says).
>Andrew
>

Just wondering, are these any different than the copies of atario21 and
util that are already on the archive?

1503. Atari Trak-Ball Progamming Article.

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-04 23:01:56 UTC
From: rkim@mars.calstatela.edu
Message-ID: <9204042301.AA11759@mars.calstatela.edu>
Source record: 111747

Okay, here is the trakball programming essay from Atari Corp. Alas, I had to retype it since the original was lost. Also, my version of this is missing the BASIC listing of example #3: VBITBALL.BAS. The assembly version of example #3 is present and working, so this should be no great misery.

Of course, if there is a great demand for the BASIC listing for example #3, I can generate it with BOFFO and re-submit the article.

Enough yak, the trakball article...

PROGRAMMING THE CX-22 TRACK BALL
William Bartlett
October 26, 1983

This document will attempt to provide programmers with an understanding of what the Atari Trak-Ball is capable of doing, how it does it, and how to tap it's potential from an application program. The scope of this document is limited to using the Trak-Ball in true trak-ball (TB) mode. Programming the Trak-Ball in joystick (JS) mode is exactly the same as programming a joystick.

Let me briefly review how the PIA chip handles the Atari joystick. A joystick plugged into port 1 will toggle the lower four bits of PORTA located at $D300 and shadowed at $278. One bit is cleared (zero) to indicate the joystick is being pushed in any of four directions; right, left, forward or back. If the joystick is stationary, the four bits are set (one). Atari BASIC provides the STICK function to provide the value of these four bits to a BASIC programmer.

HOW DOES A TRAK-BALL DIFFER FROM A JOYSTICK?

A joystick is only capable of indicating direction whereas a trak-ball is capable of indicating direction and speed. The best implementation of trak-ball application programs will reflect the varying speeds of ball movement.

HOW IS DIRECTION AND SPEED IMPLEMENTED IN THE HARDWARE?

A trak-ball plugged into port 1 will toggle the lower four bits of PORTA located at $D300 and shadowed at $278. There are two direction bits and two rate bits; one each for the horizontal and vertical axis. The direction bits indicate which direction along the axis the ball is rolling. The rate bits change from 0 to 1 and back to 0 as the ball is rolled. The faster the ball rolls, the faster the rate bits change.

HOW CAN AN APPLICATION PROGRAM UTILIZE THE TRAK-BALL?

Unfortunately, Atari BASIC is very inefficient for using the Trak-Ball. To quickly implement direction and speed it is necessary to test the individual bits of PORTA. The AND function in Atari BASIC is byte-to-byte instead of a true bit-to-bit test. Therefore, machine language is going to be required to tap the potential of the Trak-Ball.

To determine the direction of ball movement, the direction bits need to be tested only once. To determine the speed of ball movement, the rate bits will have to be sampled many times and a count made of the changes from 0 to 1 and back. The lower four bits of PORTA are assigned as follows:

```
+---------------+---+---+---+---+
PORTA >> | | 4 | 3 | 2 | 1 |
+---------------+---+---+---+---+
```

* bit 4 = vertical rate,
* bit 3 = vertical direction (0=up, 1=down),
* bit 2 = horizontal rate,
* bit 1 = horizontal direction (0=left, 1=right).

Let's assume we wish to control an object on the screen with a trak-ball.
There are two logical approaches to this programming problem. I shall refer to these as the vector appoach and the incremental approach.

VECTOR : The vector approach is to maintain a value for the horizontal and vertical locations, sample the trak-ball N times, calculate the new horizontal and vertical locations, and then reposition the object. A complication is that if the object is a player or missile, we could vector to a new location without recognizing a collision. Another complication is that of boundaries. What if the new location is outside of a boundary? Should we ignore the boundary, ignore the sample, or calculate where the vector crosses the boundary? Using the vector method we will either have complicated coding or flaky response.

INCREMENTAL : The incremental approach is to move the object when the rate bit changes as you sample the trak-ball N times. Boundary and collision checking is much simpler than that of the vector approach.

SAMPLE PROGRAMS

I have provided three tutorial programs to be used in conjunction with the trak-ball:

1) TBALLTST.BAS allows you to observe the lower four bits of PORTA changing so that you can familiarize yourself with their action.

2) TBALL.BAS will demonstrate how the trak-ball can be sampled from Atari BASIC to provide a signed value of direction and speed for each axis. The three numbers displayed are the horizontal axis, the

vertical axis, and the joystick value.

3) VBITBALL.BAS demonstrates a vertical blank routine to sample the trak-ball and move a player using the incremental method discussed above. Because the movement is done using a vertical blank interrupt (background), other activity may proceed in BASIC (foreground).

1504. Atari Trak-Ball Programming Article

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-04 23:03:03 UTC
From: rkim@calstatela.edu
Message-ID: <199204042303.AA14973@opus.calstatela.edu>
Source record: 111748

Okay, here is the trakball programming essay from Atari Corp. Alas, I had to retype it since the original was lost. Also, my version of this is missing the BASIC listing of example #3: VBITBALL.BAS. The assembly version of example #3 is present and working, so this should be no great misery.

Of course, if there is a great demand for the BASIC listing for example #3, I can generate it with BOFFO and re-submit the article.

Enough yak, the trakball article...

PROGRAMMING THE CX-22 TRACK BALL
William Bartlett
October 26, 1983

This document will attempt to provide programmers with an understanding of what the Atari Trak-Ball is capable of doing, how it does it, and how to tap it's potential from an application program. The scope of this document is limited to using the Trak-Ball in true trak-ball (TB) mode. Programming the Trak-Ball in joystick (JS) mode is exactly the same as programming a joystick.

Let me briefly review how the PIA chip handles the Atari joystick. A joystick plugged into port 1 will toggle the lower four bits of PORTA located at $D300 and shadowed at $278. One bit is cleared (zero) to indicate the joystick is being pushed in any of four directions; right, left, forward or back. If the joystick is stationary, the four bits are set (one). Atari BASIC provides the STICK function to provide the value of these four bits to a BASIC programmer.

HOW DOES A TRAK-BALL DIFFER FROM A JOYSTICK?

A joystick is only capable of indicating direction whereas a trak-ball is capable of indicating direction and speed. The best implementation of trak-ball application programs will reflect the varying speeds of ball movement.

HOW IS DIRECTION AND SPEED IMPLEMENTED IN THE HARDWARE?

A trak-ball plugged into port 1 will toggle the lower four bits of PORTA located at $D300 and shadowed at $278. There are two direction bits and two rate bits; one each for the horizontal and vertical axis. The direction bits indicate which direction along the axis the ball is rolling. The rate bits change from 0 to 1 and back to 0 as the ball is rolled. The faster the ball rolls, the faster the rate bits change.

HOW CAN AN APPLICATION PROGRAM UTILIZE THE TRAK-BALL?

Unfortunately, Atari BASIC is very inefficient for using the Trak-Ball. To quickly implement direction and speed it is necessary to test the individual bits of PORTA. The AND function in Atari BASIC is byte-to-byte instead of a true bit-to-bit test. Therefore, machine language is going to be required to tap the potential of the Trak-Ball.

To determine the direction of ball movement, the direction bits need to be tested only once. To determine the speed of ball movement, the rate bits will have to be sampled many times and a count made of the changes from 0 to 1 and back. The lower four bits of PORTA are assigned as follows:

```
+---------------+---+---+---+---+
PORTA >> | | 4 | 3 | 2 | 1 |
+---------------+---+---+---+---+
```

* bit 4 = vertical rate,
* bit 3 = vertical direction (0=up, 1=down),
* bit 2 = horizontal rate,
* bit 1 = horizontal direction (0=left, 1=right).

Let's assume we wish to control an object on the screen with a trak-ball.
There are two logical approaches to this programming problem. I shall refer to these as the vector appoach and the incremental approach.

VECTOR : The vector approach is to maintain a value for the horizontal and vertical locations, sample the trak-ball N times, calculate the new horizontal and vertical locations, and then reposition the object. A complication is that if the object is a player or missile, we could vector to a new location without recognizing a collision. Another complication is that of boundaries. What if the new location is outside of a boundary? Should we ignore the boundary, ignore the sample, or calculate where the vector crosses the boundary? Using the vector method we will either have complicated coding or flaky response.

INCREMENTAL : The incremental approach is to move the object when the rate bit changes as you sample the trak-ball N times. Boundary and collision checking is much simpler than that of the vector approach.

SAMPLE PROGRAMS

I have provided three tutorial programs to be used in conjunction with the trak-ball:

1) TBALLTST.BAS allows you to observe the lower four bits of PORTA changing so that you can familiarize yourself with their action.

2) TBALL.BAS will demonstrate how the trak-ball can be sampled from Atari BASIC to provide a signed value of direction and speed for each axis. The three numbers displayed are the horizontal axis, the

vertical axis, and the joystick value.

3) VBITBALL.BAS demonstrates a vertical blank routine to sample the trak-ball and move a player using the incremental method discussed above. Because the movement is done using a vertical blank interrupt (background), other activity may proceed in BASIC (foreground).

-rhk. (10-3-90).

PROGRAMMING THE CX-22 TRACK BALL
William Bartlett
October 26, 1983

This document will attempt to provide programmers with an understanding of what the Atari Trak-Ball is capable of doing, how it does it, and how to tap it's potential from an application program. The scope of this document is limited to using the Trak-Ball in true trak-ball (TB) mode. Programming the Trak-Ball in joystick (JS) mode is exactly the same as programming a joystick.

Let me briefly review how the PIA chip handles the Atari joystick. A joystick plugged into port 1 will toggle the lower four bits of PORTA located at $D300 and shadowed at $278. One bit is cleared (zero) to indicate the joystick is being pushed in any of four directions; right, left, forward or back. If the joystick is stationary, the four bits are set (one). Atari BASIC provides the STICK function to provide the value of these four bits to a BASIC programmer.

HOW DOES A TRAK-BALL DIFFER FROM A JOYSTICK?

A joystick is only capable of indicating direction whereas a trak-ball is capable of indicating direction and speed. The best implementation of trak-ball application programs will reflect the varying speeds of ball movement.

HOW IS DIRECTION AND SPEED IMPLEMENTED IN THE HARDWARE?

A trak-ball plugged into port 1 will toggle the lower four bits of PORTA located at $D300 and shadowed at $278. There are two direction bits and two rate bits; one each for the horizontal and vertical axis. The direction bits indicate which direction along the axis the ball is rolling. The rate bits change from 0 to 1 and back to 0 as the ball is rolled. The faster the ball rolls, the faster the rate bits change.

HOW CAN AN APPLICATION PROGRAM UTILIZE THE TRAK-BALL?

Unfortunately, Atari BASIC is very inefficient for using the Trak-Ball. To quickly implement direction and speed it is necessary to test the individual bits of PORTA. The AND function in Atari BASIC is byte-to-byte instead of a true bit-to-bit test. Therefore, machine language is going to be required to tap the potential of the Trak-Ball.

To determine the direction of ball movement, the direction bits need to be tested only once. To determine the speed of ball movement, the rate bits will have to be sampled many times and a count made of the changes from 0 to 1 and back. The lower four bits of PORTA are assigned as follows:

```
+---------------+---+---+---+---+
PORTA >> | | 4 | 3 | 2 | 1 |
+---------------+---+---+---+---+
```

* bit 4 = vertical rate,
* bit 3 = vertical direction (0=up, 1=down),
* bit 2 = horizontal rate,
* bit 1 = horizontal direction (0=left, 1=right).

Let's assume we wish to control an object on the screen with a trak-ball.
There are two logical approaches to this programming problem. I shall refer to these as the vector appoach and the incremental approach.

VECTOR : The vector approach is to maintain a value for the horizontal and vertical locations, sample the trak-ball N times, calculate the new horizontal and vertical locations, and then reposition the object. A complication is that if the object is a player or missile, we could vector to a new location without recognizing a collision. Another complication is that of boundaries. What if the new location is outside of a boundary? Should we ignore the boundary, ignore the sample, or calculate where the vector crosses the boundary? Using the vector method we will either have complicated coding or flaky response.

INCREMENTAL : The incremental approach is to move the object when the rate bit changes as you sample the trak-ball N times. Boundary and collision checking is much simpler than that of the vector approach.

SAMPLE PROGRAMS

I have provided three tutorial programs to be used in conjunction with the trak-ball:

1) TBALLTST.BAS allows you to observe the lower four bits of PORTA changing so that you can familiarize yourself with their action.

2) TBALL.BAS will demonstrate how the trak-ball can be sampled from Atari BASIC to provide a signed value of direction and speed for each axis. The three numbers displayed are the horizontal axis, the

vertical axis, and the joystick value.

3) VBITBALL.BAS demonstrates a vertical blank routine to sample the trak-ball and move a player using the incremental method discussed above. Because the movement is done using a vertical blank interrupt (background), other activity may proceed in BASIC (foreground).

-rhk. (10-3-90).

**********COMPUTER FOR SALE**********

* Atari 1040 ST
* SC1224 color monitor
* 1200 bd modem
* Okimate 20 color thermal printer
* mouse and pad
* Casio MIDI keyboard w/cables
* Atari trackball modified to work
as a mouse also.
* joystick
* 100's of programs

$695 OBO

Misc. for sale:

* Atari 130XE
* Atari 800
* percom 5.25" master drive
* voicemaster sound digitizer
* joystick and trackball
* misc. software

1508. Compute! Magazines: Sept '82 - April '88

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-05 02:21:00 UTC
From: at974@cleveland.Freenet.Edu
Message-ID: <1992Apr5.022100.6425@usenet.ins.cwru.edu>
Source record: 111752

I sold my 8 Bit and have a library of magazines that have
GREAT historical value. :)

In addition to the Compute! magazines from September 1982 through
April 1988, I also have Softside issues #39 through 41 and
January & February 1984

Finally, there is one VINTAGE Byte magazine from January 1983.

I would like $20 for this MAGNIFICANT collection.

The box weighs 45 lbs. You pay shipping from Cincinnati, Ohio.
(Either Post Office or UPS.)

Reply via e-mail.

>
I believe all you have to change is the buffer length, which is stored at
$308-309. If you're using an XF551 that has dropped into single-density,
you can set it back to double density by reading a certain sector (sector 4,
I think)

Bill Marcum bmarcum@world.std.com

1510. 7200? Atari XT? Huh!?

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-05 07:36:01 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <qyyqiB1w164w@cyberden.uucp>
Source record: 111754

On a local BBS, someone is offering an Atari 7200. I said to him "no.. you must mean 7800", but he replied, "no 7200!" What pa-zacaly IS a 7200? I chatted with my friend today and mentioned it and he said it was some sort of prototype game system. I'm not convinced. Has ANYONE here on this newsfeed ever heard of this thing?

Also, the same person mentioned an Atari XT. Again, I attempted to correct him by saying "no, you must mean XL or XE". He again said "NO.. X>T<!" I just replied to these messages, and I am waiting for details on this stuff, but I decided to ask all of you folks here, as you are all so versed in Atari stuff. Heck, I even tried looking it up in the BEST Elec. catalog! HELP ME!

Again. He said "7200" and "Atari XT" systems. So.. are there such things!?

Thanks alot. Bill

1511. Draconus...

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-05 07:40:27 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <56yqiB2w164w@cyberden.uucp>
Source record: 111655

I have just downloaded the game Draconus from a BBS in the bay area. One that says it is very much against piracy. When I first heard of Draconus, people who were talking to me about Zybex said the same people made it, which was true. The thing is, on the Carina net, we were all having a big argument on whether or not Zybex was a (c)'d game, and we decided no. So when I DL'd Draconus, knowing that the BBS is against piracy, and being pretty sure that their other game, Zybex, was PD, I was very surprised to see a "Copyright 1988 Cognito" in the credits! Is this game really (c)'d? If so, how can I get in contact with Cognito?? And if it is, I will definitely request it be deleted from the BBS. I hate seeing pirated stuff unless it is impossible, not just really hard, to find the software. Especially myself being a programmer, and wishing one day to "make it big" in the industry.

BTW: If this game is PD, it is definetly worth the LD call I made! If not, I would definitely pay for it!

Who was it who posted the original mail-order/magazine listing? Was it Chris? (won't even try to spell your last name!!)

If so, have you gotten any updates? I might type in my own copy, as I have found a few phone numbers and a little more descriptions of places you had listed.

Is the vendlist file on the archive better than the posted list, or are they the same??

>
I forgot to mention the fact that I really don't want to have two computers to take care of, but I do want all my 8bit software and all the fun the 8bit provides AND I want all the 'power' available from my PC. Since my Atari is unlikely to do a good job of running MS-DOS software, that only leaves hope that my PC can do a good emulation of the 8bit.

Dataque's XEC was very promising, since it was actually an 8bit on a card - don't have to worry too much about 'emulation' since all the hardware was actually there.

1516. Atari GAMER project

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-06 01:37:37 UTC
From: chase@electron.rutgers.edu
Message-ID: <Apr.5.21.37.35.1992.16144@electron.rutgers.edu>
Source record: 111660

For those of you who have a Macintosh, you may of heard of a project by Bob Nordling which attempts to catalog and rerelease a number of Shareware games. It is known as the GAMER project. This project has made it possible to find almost any shareware entertainment product for the Macintosh computer.

What I propose is a similar effort for the Atari 8bits. Well it would be conceivable to catalog and archive all of the Atari computer games, the goals of this project are a little more realistic. The 1st goal is to catalog and archive all the games published by ANALOG Computing. Why ANALOG? Well, in my opinion it contained the best Atari games available when I was an active Atari owner, and I always wondered whether some of the games I didn't bother to type in I should have. If this project is completed easily and with enough enthusiasm on the part of the Atari 8bit community then we can procede to expand the goals of the project to other magazines and actual shareware products for the 8bits. If the enthusiasm is overwhelming I'd like to take a stab at cataloging the enormous number of commercial games produced for the Atari, but that's a daunting task I think is better left for later (much later ;-)). (A smaller task I might be willing to coordinate would be a catalog of all the games published by Atari Corp. themselves, and a catalog of the games that were developed but never released.)

On the question of copyrights and whatnot I take a very simple position. The act of cataloging the titles and details of various games presents no problems. The act of archiving and distributing the games is legally nebulous. While most people consider the programs found in magazines to be public domain the publishers often took a different, more restrictive view. These same publishers have ceased their magazines and the companies which hold the copyrights are in many cases now nonentities. To avoid any problems that might result I am making it the purpose of the project to collect the binaries of the games for distribution to people who own the magazines but never bothered typing in the programs. I cannot restrict distribution in that fashion (as I intend to post the programs to atari.archive) but anyone who makes use of the binaries will have to understand that the intent of the project was not to allow unlimited distribution of copyrighted material. If they believe there is no problem in using the binaries anyways, then that is their decision. In any event there is no problem at this early stage of simply collecting the descriptions and source of the games for later distribution.

One final note on copyrights. By default decisions have been made about what is permissible to include on atari.archive. There are

several games and some source listings from magazines currently there, so I don't suspect this project will stir up any real trouble. I felt it was necessary to treat the issue seriously however, but I did not intend to start a long discussion on the nets about whether those games should be on the archive or not. What I want most out of this is a list of games available for the Atari. What I would also like is a way to obtain those games as well, but that issue can be addressed later if the database project proceeds smoothly.

Enough talk about legal crap. If you're interested send me some email telling me what magazine issues you have access to, how many games from those issues you may have on disk somewhere (a rough guess), and how much time you're willing to contribute to the project. Ideally I'd like everyone to email me a description of a few games, what issues they came from, and a brief review of them. But I don't want everyone to send me a description of "Livewire" from Analog 11 (?), so there is going to be some coordination involved.

Even if you're not interested in helping out I'd like email messages concerning your "All-time favorite Atari video game". Anything from just the title to a long discussion of why every other game pales in comparison to your favorite. I'll post a brief list to the newsgroup once I've gotten enough responses.

Thanks in advance for your interest.

1517. Any DIFFs or GREPs for the 8-bit?

Newsgroup: comp.sys.atari.8bit

Source record: 111663

Hi, I have a question. I have just recently acquired an MIO a
Tandon TM-503 hard-drive, and an Adaptec 4000a controller. I was
wondering if anyone has had this configuration before and/or could tell
me about the jumpers that need to be set. On the Adaptec controller, there
are two sets of jumpers labled:

```
r
pu . . . s
.
t
```

and:

```
. . . . . . . .
. . . . . . . .
p l n j h f d b
```

I am curious as to what these are. ALSO: How do the jumpers need set
on the Hard-drive.

The only documentation I have for any of this stuff is the 45 printed sheets
for the MIO.

I don't have ANY of the wiring needed to connect these components together,
or even a PC type power supply, so I have a while before I can get it set up.
*** If anyone has a power supply for sale and/or the necessary cables
I would like to here from you. *** I could always just build the cables
if I could find a store that carries standard computer supplies (UNlike
Radio Shack!).

Well, I've rambled enough..... ANY help would be greatly appreciated.

Thanks,
-Adam Conover.

It is possible to use a Trak-ball with Missile Command. Simply type
control-T.

BTW it seems that the mouse from the Atari PC/ST is compatable with the
Trak-ball, since it works fine if substituted.

Source record: 111666

I have an XEP80, and it's really cool! Sure, it could have been
better, but all in all, it's really neat.

What you have is a box, the same size as the SX212 modem (same case
in fact), with joystick plug coming out of the back. Plug it into
joystick port #2, and run the XEP80 driver. Basically, the XEP
is a dumb terminal. The 8-bit sends data to it, and the XEP in turn
displays it on a monochrome monitor. The text display is very fast,
I'd estimate it to be at least 9600 baud equivilent. IT also has
special text modes, like 40 or 80 columns, blinking, underlined,
inverse, double-wide, double height, etc. In fact, the screen is
a virtual screen. The XEP will accept up to 256 columns and scroll
accordingly. It works very well.

Also included with the XEP is a built-in printer interface, with
the standard DB-25 plug, so you can use a normal printer cable.

One really neat thing is when you use the XEP with BobTerm, Bob
Puff's telecommunications program. If you have two monitors, it
works best. You get the BobTerm menu screen on your TV or composite
monitor, and the online text display on the monochrome monitor. It's
wild!

Overall, it's really nice. They're selling used for $50 or so nowadays.
Pick one up if you can find it.

Having just finished perusing over three years worth of Current NOtes,
I ran into a set of articles from A. Rojo. The name sound familiar?
He was doing reviews of game software, including Zybex, I don't know
if this other game was in there, but now it seems that these games are
in fact copyrighted. Or at least that seems to be the case to me.

You might want to give either ICD or Computer Software Services a call.
Although CSS sells a competing product, the Black Box, Bob Puff is
an expert on Atari 8 bit hardware, and is almost always willing to help
out a fellow Atari 8 bitter. He can also supply you with Power supplies
for your HD if I remember correctly. Anyhow it wouldn't hurt to
give him a call, or call ICD and ask them about it.

>
>--
I know several people who use these, myself included. The display is
much clearer than any 80 column implementation you will see done using
any of the GTIA/ANTIC graphics modes. Of course display clarity
also depends on your monitor. On my Teknika MJ-10 color monitor, the
display is better than the standard 8 bit display, but it isn't
as good as when I use my Goldstar Monochrome monitor.
In fact I like the 80 column display so much that my Teknika MJ-10
color monitor sits up on a higher shelf, used only when I need to play
a game in color or see a demo or something. For everyday work,
it's the Goldstar greenscreen monitor. I hardly miss the color.
Depending on which software you use, the XEP80 can act slower than the
standard display. This is especially true if you have many programs that
write to the standard 40 column screen by poking the characters
directly into SCREEN RAM. You simply can't do this with the XEP80.
Everything has to be done by writing to the E: and S: devices.
This presents a bit of a problem, you can't expect all your software to
just run on the XEP80. Mydos works fine, and so does Sparta and SD-X.
Running the FORMAT program requires you to flip back to the 8 bit
40 column screen to view its disk formatting options. That reminds me
the XEP80 has its own output for hooking up to a monitor. SO if you
want to see both your standard dislplay and the XEP80 display, you
either get two monitors sitting side by side, or get a switch to
switch between the two different video outputs going to the one monitor.
Ben Poehland talked about such a project an issue of Current Notes
sometime last fall. I have a little box with a rocker switch
attached to the side of my monitor using velcro. It works quite well.

Anyhow there are some programs written specifically for the XEP80,
including MORE80 for SpartaDOS, Atariwriter 80, Turboword +, Turbofile,
and EMAX, Bobterm, VT850, and I suspect a few other terminal programs
that don't come to mind. The XEP80 output is slower, but the display
is worth it.

Source record: 111670

In a previous article Michael Current writes:

>Just wondering, are these any different than the copies atario21 and
>util that are already on the archive?

Yes !!!! They are different !!!!!!!!!!! Or at least util.exe is.
Now it works as it should, while the older version of UTIL on the
archive failes to write in binary mode. The new version posted
recently by Andrew _does_ work in the binary mode.
The source listings seen to be far better documented as the old ones.
As I could see by now the new version supports some formats that
the old version doesn't (double sided drives?).

Thank you Andrew for this uploading. Now I can supply my dear Atari
with software without problems.

Somebody who is responsible for the archive should replace the old
version of util.exe with the new debugged one. Thank you.

Well, I just happen to have my handy-dandy ACB-4000 Series User Manual (great technical manual on the 4000 series from Adaptec which I bought in hopes of getting a hard drive for my 8bit which I've never been able to afford...) in front of me...

Page 3-6 states:

JUMPER DEFINITION INSTALLED REMOVED
A-B LSB of Controller's SCSI Address bit = 1 bit = 0
C-D Controller's SCSI Address bit = 1 bit = 0
E-F MSB of Controller's SCSI Address bit = 1 bit = 0
G-H DMA Transfer Rate SYSCLK/4 DATACLK/2
I-J Extended Command Set Enabled Disabled
K-L Not Used
M-N Support of Syquest 312, DMA 360 and drives that Enabled Disabled
drop SEEK COMPLETE signal during head switch
O-P Self Diagnostics Enabled Disabled
R-PU Write Precompensation turned off for drives Enabled Disabled
R-S Write Precomp starts at same cylinder as Enabled Disabled
reduced write current for drives
R-T Write Precomp is applied to all tracks Enabled Disabled

Hope this helps a bit. Let me know if you'd like to anything else on the 4000A. Cables and a power supply should be simple to get. Try a Computer Shopper for the power supply.

Hi. I just got the newest available version of Bobterm from atari.archive a couple days ago and I was very pleased to see that it had vt52 terminal emulation instead of vidtex as v. 1.10 did. Except for one thing - it doesn't seem to work for me. I have another vt52 emulator (VTERM) that works just fine when I configure the other computer to do vt52, but when I try the exact same configuration with Bobterm it chokes (i.e. the text formatting on-screen is garbled, bad cursor positioning).
I think Bobterm is great, but I can't really use it because of this problem. Does anybody have any suggestions or similar problems? Is there any way to get a hold of Bob Puff through the internet? I know about BBS's that would do the trick, but I would rather not rack up long distance phone bills (poor starving college student and all that...).

Thanks very much for any assistance!

Adam- yup, the hot cap in your Type III supply is a sure sign of trouble, as I recall the Type III had the skimpiest heatsink too, a crummy little silver thing w/maybe half the thermal capacity of what they put in the Type I. If you have any sort of junkbox heatsink you can add on to what's already there you will improve things a little.

I agree, 4700uF is probably too low. 10,000 is better if you can find one- but large values of the propers physical size are rarer than hen's teeth. On mine I used a 6800uF scavenged from a dead printer. Some 1050 drives were equipped w/6800/25VDC caps; if you have a dead 1050 or know someone with such, that might be your best source, I don't believe Radio Shack carries anything that high a value in radial-lead caps, they probably stop at 2200uF. I would give Brad Koda at Best Electronics a call first, he knows about all this stuff & might have something lying around even if it isn't a catalog item.

Sorry if you had problems reaching me, my email address is:

poehland%phvax.dnet@smithkline.com

(I think I'm actually on DECnet), my site is *supposed* to be able to rcv msgs from INET, BITNET, & UUNET. I haven't attempted to reply to you personally as I wanted folks here in IA8 to know about your problem & how it can be fixed. Hope you'll be able to locate a replacement cap, good luck.

Maybe someone could give the phone # for Best? I don't have it here at work.

I know this doesn't qualify (since you say unmodified), but Bob Puff's (CSS) XF551 upgrade allows you to read 360K MS-DOS diskettes, even if you don't replace the 5.25" drive with a 3.5" mechanism.

1532. Toronto Show.

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-06 23:13:01 UTC
From: a644690c@edinboro.edu
Message-ID: <00958B667C67F300.20C02F49@edinboro.edu>
Source record: 111676

Well,

I just wanted to give all the 8-bitters out there my impression of the Toronto Atari show that was held this past weekend.

As you may all guess, the show was almost exclusivly ST/TT stuff except for a Lynx display and game area. I guess there was a company or two selling some old 8-bit carts., but I couldn't find anything. However, BEST Electronics was there with lots of goodies. (I didn't buy anything becaus I have a rather large order pending and I didn't feel like being severly hastled by customs for a SECOND time [another story]). I did however end up meeting Mr Bob B. himself! Actually, I remained rather quite while a friend of mine kept (embarrassingly) harasing him about "what ever happened to the 8-bits". He seemed like a rather nice fellow though. I, myself, only chatted with him breefly.

I also was able to meet some members of some French Canadian user groups whom I plan on exchanging some Shareware/PD stuff with. And I met Patty R. from AIM who was also a very nice woman.

Right across from our booth (S.A.G.E) someone had an 'Atari History' booth set up. I was rather disheartened to see a lot of the machinery that *I* use every day sitting on an 'old and obsolete' shelf.

All in all, For the 16/32 Atari owner, the show would have been great, but if you only own an 8-bit..... You didn't miss much. Oh well, I had fun anyhow. From the looks of the show the new Atari stuff seems to a lot of potential. It struck me as rather funny when one day a friend mentioned, (an Amiga owner who had never seen an 800xl), "Hmmmm, ya' know..... That thing acts like it could be just an 8-bit Amiga." Does that meen that the Atari ST is really a 16-bit C=64 ????? :-) I wonder.........

Peace,
-Adam Conover.

Hi,

(I wonder how many posts I've made today....)

Anyway, I have a Question: I got ahold of a digital mouse the other day
and have hacking around with it. I figured out how it transmitted its data
in about 15 min., but the BASIC test-driver I wrote was not even close to
fast enough to work. I am wondering if anyone has a digital mouse handler
that will work under SDX or SpartaDOS.

Thanks....

-Adam Conover.

I've got both Light Speed & Turbo C on the IBM, and really, Lightspeed isn't even close to being as good of an implementation as Turbo. LS is the best I've seen on the Atari, but some of the things that are supported in just about every other C, like easy floating point access, are more difficult with LS. Some things like structures are not supported at all. On the other hand, if you just want to do some things like translate a data base or terminal program it would work fine. It also has a lot of hooks & bells for the Atari, like PM Graphics, that are suitable for tweeking an application.

Source record: 111682

I wasn't aboe to reply to the orinigal post about the MIO, Adaptec 4000a and Tandon drive, but it sounds like the exact same setup I had before I got twin Seagates. The 'J' jumper had to be closed because the Tandon was an SASI drive that needed the "extra" instruction set that is available on the Adaptec controler. That jumper set is for SASI drives. In the other group of jumpers, I closed the "T" jumber for faster read/write access to the drive. I ran a Tandon 502 (just a little smaller than the 503, but other than that, the same drive)
and a Miniscribe SCSI drive off of the 4000a.

Lightspeed C isn't all that good an implementation of C, but you can make it better by using the PD CC8 compiler (should be at the archive) with the Lightspeed linker and runtime library. CC8 supports structures and unions, and perhaps some other things that Lightspeed's compiler doesn't understand, and CC8 also recognizes REAL curly braces, tildes, etc. I made a custom character set to use with Textpro with the curly braces so now my C programs for the Atari at least look like the real thing. I think the combination of CC8 and Lightspeed C is about the best we've got for the Atari. I tried fooling with C65, but found it's compiler to be so S-L-O-W that it drove me nuts, so I never bothered to try to expand its limited function library. A full C implementation for the Atari that could compile a reasonably sized program in less than a lifetime is something I've been wishing for for years. But in the meantime there's always Action!

Source record: 111688

Accualy I know af an Apple 2 emulator for the IBM, and an AMiga one. Both don'T work as well as the original, and on one you need to find your own OS. The Atari emulator isn'T really new. In fact I got the source for one. ANyway, the IBM can do emulations, but most people want into IBM software whatever the system, not into another.

> Hardware emulator would be running, wasting time, not the translator
> emulator program.

The reason Xformer is an emulator and not a code translator is because
a lot of 8-bit code (and 68000 code for that matter) uses self
modifying code. So if you translate the code it is no good because
the code modifies itself. A good example is ST Xformer itself. Every
time it executes a new 6502 insturction, it modifies the 68000 code.
This happens about 130,000 times per second on an 8MHz ST. Now, if
every time the code got modified you re-translated it, you'd
be wasting a lot more time. I thought about translating the Atari BASIC
and ROM OS code, since that obviously does not change, but by eliminating
the "fetch and execute" step of the emulator you'd only save about 30% to
50% of the time. It might be enough to make Atari BASIC run at full speed
on a regular ST, but it would also increase the memory requirements a
lot. All this translated 6502 code would take up space as 68000 code.
Plus, you have to translate the code at every single byte, since there
are cases of code I have run across (usually in copy protected software)
that has two different routines coded into the same piece of code. By
just executing the code one byte before or after you end up executing
a completely different routine. It's messy.

1548. DOS XE?

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-08 17:31:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19920408173136.0.JRD@MOA.SCRC.Symbolics.COM>
Source record: 111692

Date: Fri, 3 Apr 1992 16:57 EST
From: mips!sdd.hp.com!@decwrl.dec.com (James W Dittmer)
[...]
Due to a couple of requests for Atari DOS 2.0S and 2.5 I ftped arc-ed,
diskcomm-ed files of 2.0S, 2.5, and 4.0 to the archive. I also placed DOS XE
in my account but did not ftp it since I wasn't sure if it was PD.

I wanted to send a description of the files to jrd but didn't know the rest of
his address so I sent it to Info-Atari8@NAUCSE.CSE.NAU.EDU which appears in the
"8-bit.text" file.

I uploaded the files late at night, the next morning jrd posted the following:
"Does anybody know what's in the 3 files called DOS20S.ARC, DOS25.ARC,
and DOS40.ARC which were recently uploaded to the 8bit section of the
archives? Would whoever uploaded them please contact me? Thanks..."

So, I emailed the same description to jrd@STONY-BROOK.SRC.SYMBOLICS.COM. Mail
to Info-Atari8 is apparently lost or ignored.

No, but due to the usual lossage in the mail/news distribution system,
it doesn't work properly all the time.

I never saw either of the descriptions that you mailed; care to try
again?

Later I ftped the archive and found that the DOSes had been deleted.

I deleted them, out of concern for the possibility of copyright
violation. If they're copyright Atari, that means we can't put them up
for public access. If they're safe to post, could you let me know?
I did
find the file readme.txt in the "new" directory.

---- readme.txt --
If you're uploading things into this directory for inclusion in the
8-bit archives, please take the time to put together a brief description
of whatever you're uploading. Include it as a separate file, or stick
in a .ARC, or whatever, but please include it. Dumping random files
with random names simply encourages things to get lost or misfiled.
Thanks for your support.

-- The Management

Pet Peeve: I hate it when people use phony pseudonyms.

Sorry you don't like it, but that caveat applies whether it's me doing
the archiving (as it has been lately) or Ravi, or anybody else I can get

to volunteer.

In answer to your article in comp.sys.atari.8bit

> Article: 7667 of comp.sys.atari.8bit
> From: moon!cyberden!phbill@well.sf.ca.us
> Newsgroups: comp.sys.atari.8bit
> Subject: Current Notes
>
> [body of message deleted]

I haven't recieved an Info.Kit for whatever it was you were talking about.
I haven't asked for one yet, so please send me one.

I'm assuming its ascii text that I can print out on a standard printer.
I'm assuming, I pay nothing, just print it out and mail it in to show
my support for an 8-bit magazine which would also be free, and distributed
to the net. No ST/TT garbage unless its talking about networking the 2.

I am planning on networking an atari800xl to a i80486/33 using desqview
and public domain software/a null modem cable. I might also buy one
of those gadgets that simulate an atari serial drive (or two :))
I used to run a VERY fast atari bulliten board with a 2400baud modem
and a 1meg M/IO from ICD.

I would also be willing to write articles for any 8bit atari magazine about
these and related topics.

I'm assuming the magazine is going to be net distributed at no charge and
with someone (authorized) providing hardcopys mailed to people for cost.
Ie for people in foreign countries, etc.. who have no net access.
ie cost for paper, ink, postage only.. if noone will send a free copy.

I've also never heard of 'current news', so any info you could provide
on that would be helpful.

*** mild flame on

I don't want to be rude, but the message recieved by me on comp...8
seemed to be the classic 'hey, lets jump on the bandwagon'-commercial
type message. Although, its fine for convincing high school age
students.. sigh..

I just think it would be better if you just gave a more factual based message that sums up previously known info that can be distributed and taken serious. This is very serious to me. Atari 8bits are very powerful machines in their own way (Thats why very fast machines can't simulate them without additional hardware). I spent ~$110.00 about 2 weeks ago to buy a new one, since my old one died. There are some very talented hackers (in the good sence of hacker) that stick by their machines.

I also think a 'net available magazine' is a great idea. It provides a powerful medium to HELP people get the most out of a machine that atari dis-associated themselves with a long time ago. I provides a means for comunicating with atari, other companies and showing our support. Without any need for them to advertise because there is no profit involved.. Just 8bit-atari-lovers sharing info.

> FOR ANY OF YOU WHO >GOT< THE INFO.KIT, BUT HAVE NOT SENT THE POSTCARD
> BACK I WILL >PERSONALLY< GO OVER TO YOUR HOUSE AND >KILL< YOU!!!

just an example of why this mild flame.. note the uppercase letters, the word 'kill' and the lack of fundamental info in this sentence... Note that alot of people reading this message have young children.

*** mild flame off

Since atari...8 is not really one of the more high volume newsgroups, I think I will post a copy of this message there for us 8-biters to gawk at...

I also, eagerly await info on this 8-bit electronic magazine and will be sure to distribute it when it get it.

For those with acces to 'irc' try looking for me in the #atari group! I seem to be the only 8bit one there but, as always, it seems the atari group contains highly educated people, who share ideas, and progams freely.. lots of them speak german too.. for you german speakers.

I'm known as FreeBird when I'm on, although I've been using the handle/ nickname free-bird too cuz, some bozo keeps stealing my handle and idling. Just check, if he's from germany, its not me, if he's from USA, ????.umbc.edu, its me..

Cuz I'm free as a bird now.
And this bird you can not change.
Oh..Oh..Oh..Oh..Oh..Oh..
And this bird you can not change.
-Lynyrd Skynyrd (Free Bird)

Okay, I suppose I'll stick my head in here now. I responded to the original poster via email, but since this is such a popular topic I'll say a few words :-)

Bonk was not a commercial game, it was published in the pages of ANALOG Computing--the October 1985 issue to be exact (right before Charles F. Johnson's G: article). The game, IMO, had a pretty good concept (keeping in mind that magazine games had to be simple), but I didn't spend enough time designing levels for the dang thing. It probably could have turned out better than it did. But several people have told me that they still play it, so I guess I did something right.

Yes, I wrote some other games for ANALOG and Antic (trivia: can you name them? :-) I was happy with Electroids (buggy though it was) and Current Events and E-Racer. I probably got the most attention for Uncle Henry's Nuclear Waste Dump, which was my version of Tetris a few years before the orignal. Unfortunately, I didn't get the gameplay exactly the way it should have been.

Anyway, I'm always amazed when someone remembers this sort of thing. I've gotten email from half a dozen netters over the past year and a half about old magazine articles with my name on them. And one guy who got me confused with Bill Hogue of Miner 2049'er fame! Ah, the good ole days...

1555. Golly... phraze search..

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-09 00:24:19 UTC
From: moon!cyberden!phbill@well.sf.ca.us
Message-ID: <9mTXiB15w164w@cyberden.uucp>
Source record: 111699

I suPPOSE that this could work in BASIC to search for a phrase (Note: I'm making this program up as I go, so don't trust it! :))

```
1 REM >>> PhBill's Phraze in a Phile Searcher <<< (written online!!)
2 DIM F$(120),PZ$(120)
5 REM Maybe set up the screen...?
10 ? "File name";:INPUT F$
15 REM Maybe go add "D:" or something... whatever
20 TRAP 10:OPEN #1,4,0,F$
25 ? "Enter phraze to search for (up to 120 characters)"
30 INPUT #16,PZ$:REM #16 removes "?",adding a whole character to inputs!
35 ? "Working..."
40 FPOSITION=0
45 TRAP 100
50 FPOSITION=FPOSITION+1:GET #1,N
55 IF N=ASC(PZ$) THEN NOTE #1,FX,FY:REM finds a "jump" point if not found
60 IF N=ASC(PZ$) THEN GOSUB 150
70 GOTO 50
100 REM end of file!
105 ? "End of file reached! - The end! -":END
200 REM found.. keep finding!
205 FOUNDPOSITION=1
210 FOUNDPOSITION=FOUNDPOSITION+1:GET #1,N
215 IF FOUNDPOSITION>LEN(PZ$) THEN ? "Found at ";FPOSITION:RETURN:REM :)
220 IF N=ASC(PZ$(FOUNDPOSITION)) THEN 210
225 ? "Nope, not yet!":POINT #1,FX,FY:RETURN
```

Well.. I hope this works ok. If it doesn't, if you can fix it, repost it! As the REMs say, upgrade it a bit to fix the screen colors, and add a "D:" adder and stuff. In theory, what I did should work. Here's how it goes. Say you input "HELLO" as the PZ$ (phrase to find)..

In the file, the text goes as follos:

THE WORD HELLO IS VERY HELPFUL.

The file will find the "H" in "THE" and match it to the "H" in "HELLO". It will jump to the "continue searching" routine of the program at line 200. This will find the "E" in "THE" and match it with the one in "HELLO", but when it comes to the " " between "THE" and "WORD", it will quit, because the " " isn't an "L", no matter how crazy you are.

From here, the file pointer will jump backwards to the "E" (I HOPE... :) if it gets stuck in an endless loop, just add a "GET N" command after the "POINT".. command.

When it hits the "HELLO", the entire word should be found (how much you wanna bet you get an ERROR 5 at some point!?) It SHOULD return a "phrase found at 10". After that, it will skip to the " " between "HELLO" and "IS". If you want it to jump to the second letter ("E") in the found phrase, add a POINT #1,FX,FY and possible a "GET N" (see above if the program get stuck). When it finds the word "HELPFUL", it will do just like with "THE" and find the "HEL" in "HELPFUL" and match it with the first three matching letters in "HELLO" I suppose, if you said "HEL" for the phrase, it would say that both "HELLO" and "HELPFUL" match. If you add a " " at the end, you'll get neither... oh well.. of the subject now!

Hope I helped! :) Later, all! Bored bill.

1565. Bob Wooley's 80 columns

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-09 20:58:40 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Apr9.155841.10666@miavx1.acs.muohio.edu>
Source record: 111609

Well, this is going back to the post about Bob Wooley and his 80
column upgrade. I was thinking how to have it compatible with programs
that poke directly into memory. Well I thought of a kludge way of doing
it. Set up screen memory like this

0 --------- 39 40 ----------------- 79
Store columns 0-39 And then followup
in a 960 byte conti- with the remaining
guous block 960 bytes

That way program that poke directly into memory will be in forty
columns, but this way is a big kludge!!

Later.......

Ok, hardware gurus! I have this 1050 with U. S. Doubler upgrade, and it has worked fine for the last year. Suddenly, the other day, it starts a very nasty habit: the lowest-order bit in the 64th byte of each sector is stuck low (upon write only, not read)! I reseated all external connections; no go. Then I opened the thing up and reseated all the internal friction-fit connections (socketed chips and those little plug deals). It started working; I chalked the experience up to oxidization. Then, the next day, it goes right back to sticking the bit low! Not only that, it starts intermittently doing the same thing on the 21st or 33rd byte of each sector!! HAAALLP!!! What do I do now??

It's been MY experience that what the "BBS world" calls "VT52 terminal" emulation, ISN'T. The VT52 is/was a Digital Equipment Corporation terminal that responded to a set of escape sequences similar, but not identical to, those later incorporated into the VT100 (VT1xx series), VT2xx, VT3xx, and VT4xx series terminals. The "BBS world" VT52 seems to be some bastard thing with all kinds of BBS-specific extensions for doing color, graphics, and God only knows what-all else. I personally avoid "VT52 emulation" at all costs, because I never know what I'm getting -- the only thing I CAN count on, is that it ISN'T REALLY A VT52 EMULATOR.

Just two cents from

Yeah, designing the thing could be ugly. With the regular way,
it's easy to just tell the processor to start looking at one point
and just continue reading screen data until it's got as much as it needs.
This way the chip has to read half a line of data, skip to next line
and read half a line of data. skip.. etc. etc. then read the second
halves of each line... ick. There's just no simple way
or working around the problem is there?

I guess all you can do is comprimise. Those programs that use the
E: and S: drivers work fine. Those that don't... well I guess
you get screwed, or you program the display back to 40 columns first
then run the program and then turn 40 columns back on.

Have you ever seen or used Turbocalc? Dataque did a really nice
pop-down menubar at the top for his user interface. It's one of the
things I really like about the program. The routines are
fully licensable from Dataque. Also, have you ever seen
CGM or Castell's Graphic Manager from the Analog 8 bit Extra?
This was a really neat windowing set up USR calls,
You even had a pointer defined from 4 8x8 characters. It's pretty
cool, but was copyrighted. The book said only owners of the book
were allowed to have the program. That was pretty short sighted of
ANALOG. I wonder where such copyrights stand now though.

Jeff McWilliams

BTW, it still bothers me how easily the Apple machines can be
upgraded to faster 6502 CPUS and our computer can't. One thing they
definitely have advantage over us.

1574. questions about MIO's 80 columns, SIO2PC, z-modem, other misc.

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-10 08:29:42 UTC
From: cs331333@umbc5.umbc.edu
Message-ID: <1992Apr10.082942.10158@umbc3.umbc.edu>
Source record: 111618

Well, I posted my first article a few days ago and received some pleasant responses. Makes me happy to own an 8-bit atari again.

Anyway, I have some questions for all you 8-bit atari gurus.

A) On the atari archive, there is a program called 'SIO2PC' which reportably will allow you to hook a cable/device from an 80?86's comm port to a atari serial port and emulate an atari disk drive.

I think the author/designer's name was Nick Kennedy. Does anyone know if he has an E-Mail address? Does anyone know if he still puts together the devices? Does anyone have one of these devices and have any comments to make about it?

B) Has anyone taken up the task of writing a z-modem driver for the 8-bit that uses the rs232 port?

C) I own an ICD M/IO device. Supposedly there was a 80 column option for it. Any comment about this thing would be appreciated. ie. are they still selling them? Is it possible to make one? What kind of drivers/support is/was available for it? Is it possible to have two monitors using it, ie: one to 80 column, one to 40 column gamebox, one to regular monitor output, or any combnation?

D) Can anyone think of a cheap way to allow an 80?86 detect whether the atari has crashed, and reboot it if it does? I figure having the 80?86 have a line to one of the joystick ports from a parrell printer port and toggle a status bit every minute/second or so, then have the same parrellel port on the 80?86 signal a device to shut down a regulated power supply should the atari quit responding (ie crash).

A way to do this in combination with the sio2pc would be perfect. Ie: It would be nice to have all of the atari-related functions be regulated by one comm port. Any suggestions would be appreciated though.

E) has anyone had any experience with hooking two atari computers via the joystick ports?

I know that Nick Kennedy could probably help me emensely with both A) and E) but I don't want to get involved in a length mail coorespondance plus I'm a 'starving college student' as far as phone bills goes. If Mr. Kennedy has an E-mail address that would be perfect, or if some kind soul would be so generous to foward mail to a BBS where he can be reached and back again to me, I would be very happy. Or if someone could explain a method for transfering e-mail to bitnet, fido-net, compuserve, etc if he's on one of those networks.. or even pc-pursuit (gag..).

Anyway, feel free to email me with any comments. I always reply to it.

If I get any particularly juicy tidbits of info, I'll post them here.

Thank you,
David M. Steibel (cs331333@umbc5.umbc.edu)

The two 850's he had advertised ar not disk drives. They're
interface modules, for hooking up printers and modems.

Anders Skelander...what a cool sounding name...

...anyway...I think BONK was published in some magazine like ANTIC or ANALOG or something like that. Ergo, it's PD I think.

1578. ATARI CLASSICS CAMPAIGN: LAST WEEK!

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-10 23:46:07 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9204102346.AA02028@smithkline.com>
Source record: 111622

********** ATARI CLASSICS **********
********** CAMPAIGN UPDATE **********

This is the last week of the mail-in campaign effort to get an all-8bit maga-
zine started. The Campaign officially ends Wednesday, April 15, 1992.

Those of you in the USA or in other countries around the world who have
received a Campaign Information Kit, please make sure you fill out the return
card & drop it in the mail as soon as possible.

Due to a mailing snafu in which a shipment of info-kits went from Pennsylvania
to Jeff Mcwilliams in Michigan via Canada & thus arrived a month late, there
are still about 50-60 kits in our distribution pipeline even at this late date.
Obviously these last kits won't reach their intended addresses until after the
April 15 deadline, but the Campaign Committee encourages you to return the card
anyway. Although the printing/shipping of kits to Campaign distributors has
ceased, it will still take the Committee a few weeks to tally returns and
prepare a final report. The report will be released to all public and private
media without restriction, probably around the last week of April or the
beginning of May. Late returns arriving between the official close of the
Campaign on April 15 and the time the final report of the Campaign Committee
is released, will still be counted and included in the final tally.

So..... RETURN YOUR CARD!!! You still have time!!!

If by means of this announcement you are just now finding out about the mail-in
campaign and want to participate, sorry it's now too late. The Campaign has
been operating since January 12, 1992, and the time is upon us to see where
we stand and decide whether an independent 8bit publication is realistically
feasible.

The Campaign Committee welcomed the addition of Dave Blears who has represented
Campaign interests in Australia and distributed info-kits there. Many thanks
for your efforts, Dave!

I don't have a precise tally of returns, but adding recent international
returns to the last report from Jeff McWilliams puts the figure at just over
400. We are getting *close*, people! This is a real nail-biter!

Over the course of the Campaign, a total of 1512 Campaign Information Kits
were printed and shipped to usergroups and distributors, of which all but the
aforementioned 50-60 still in process have been mailed out. This was a serious
effort. The work of the Campaign Committee is drawing to a close.

The final outcome now depends on YOU.

- BEN POEHLAND
The Alchemist

>
>I deleted them, out of concern for the possibility of copyright
>violation. If they're copyright Atari, that means we can't put them up
>for public access. If they're safe to post, could you let me know?

All of the DOS's put out by Atari Corporation are in the public domain.
They are copyright by Atari Corp., but the copyright does allow the
software to be distributed, since it is something you need to use on
most disks. DOS XE was sold by Atari, but also released to the public
on bulletin boards. So, you basically paid for having Atari mail it to
you if no-one you knew had a copy.

I've never networked through a joystick port. bUt it is possibal through the SIO port. Just switch the data lines. The joystick would roboly require mor work, but all you would have to do is hook the data and ground lines togeter on each, and set one port for input, one for output. Then send data a nyble at a time. Or for faster speed, have softwhere send both through each port, and use an Xmodem type thing to change directin for status bytes every so often. If you try it make sure that ower can'T flow from one computer to the other.

The easyest way to upgrade an atari is to put a 65C02 in. this will speed things up. You coud possibally double the clock spped, but remember that the speed of the atari (1.72mhz i think) was selected because it is easy to slave the computer to the TV. Speed things up and you lose this timing. So the OS must be rewriten, amoung other problems like no programs work. IF every atari user wants to we could use the PBI on the XL/XE to add a coprocesser, perhaps speeding up math. A good programer could use both at the same time, if there is off board memory, and comunicate only when nessicary.

I <finally!> got Oasis Jr.working (after MONTHS of sitting lonely on a disk). But I have a few probs. When it hangs up on someone, the modem never disconnects (never fear, I'll explain my setup in a sec.). Also, how can I set it to autoanswer whenever it resets (ie. w/o me having to login local and go to the [term] mode and type "ats0=1" if I have to turn the modem off (like when someone hangs up on me!))??

My system is as follows:
SpartaDOS 3.2d (tdline, td off, key off)
Bob Puff's Fast R:verter for my modem (I use it with BobTerm 1.21)
Atari sx212 modem
1050 drive (enh/sing den. only :( )

So?? I believe the configuration says "850" for modem (that out of ATR, 850 and AVATEX... remember this was made back in '86, b/4 the sx!!)

Thanks for any help! I hate having to unplug the phone
cord to hang up!!!!! ARGH!
Later atari-lovers BK

Source record: 111633

It's been a while since I've read the 80 column article, but as I recall (& from looking at spec sheets on the 6545/6845) that would still have problems. All of the displays use a bitmap type display similar to a graphics(8) screen & in Bob's mod, seperate ram for the video chip. It's the equivalent of 640X200 or so, takes at least 8k(16k?) of video ram to do it's stuff. Think of it sort'a as a dedicated chip that plots characters on a GR.(8) type screen. IMHO: The Antic & GTIA chips we have are nothing short of great. They work by translating a single byte stored in ram into an 8X8 character W or W/O color(s). I have a low opinion of opinions including my own <g>, but I'll bet you'll hear a lot of moans from people using '286 or less & 8 mHz 68000 based systems as equipment like 19,200 baud modems & nets with transfer rates of 100 kbaud get more popular. They just won't be able to keep up with the screen scrolls. Sheesh! For that matter my 8 mHz '286 can't even do 2400 BAUD! You press ^S & the text keeps comming from the buffer for about 1/2 a screen! Of course the manufacturers will convince people to by $$$$ giga Hz workstations & somebody may come out with an [IBM, ST, Amiga, MAC] version of the Antic & tout it as the greatest breakthrough in computer graphics ever <sic> & they'll be sorta right <g>.

Need some help-
I have an 800 and a 130xe (upgraded to 320k ram),2 1050 (one doulbed)
an indus gt and a rama 1000 drive, 1030 modem, 830 modem, serial/paralle
interface (for modem and printers) and a 40 column atari printer (used to
run a bbs in Kansas City a few years ago)

What is all this stuff worth, its just sitting in a box.
I have a ST and a 386 and am just keeping it around because I love
the stuff even though I don't use it.

thanks
Karl Schimmel

DeTerm is a windowed, menubar'd text terminal program. Of course, like
every other term program I've seen (even the few I've seen on Itsy Bitsy
Machines) except BobTerm, once you leave "term-mode" you >start< losing
information (except on DeTerm the breakout game still lets you d/l and
recv.. and even also during disk-i/o on a d/u/l!! hmm!)
Too bad this type of code wasn't put to BETTER use! I mean, why
not hook up your 2600 and have a switch between it and the 8-bit!...
Oh yeah... can't pause many 2600 games, can you.. too bad

(or did I already post about it here??)

Well.. I've got Oasis Jr and Fast R:Verter (from BobTerm 1.21) and an SX212 and when I set it up, I always need to login and go to term mode (^9) and enter the command and then hang up (G,Y or shf^G) and let the wait screen (slowly) reset. This isn't too much of a problem, but the fact that the modem never ACTUALLY hangs up on a logout sort of annoys me! Should I use the RS232.COM file from the OASIS arc (it's supposedly for the 850) or should I try the ATR or AVATEX handlers? Or should I just rumage around for that old SX handler arc??!

The other major reason I think that the Fast R:Verter from BobTerm should be replaced is the fact that out of 5 or 6 IBM users, only >1< person's [RET] key works properly. On the others, it returns a [^M] character and the BBS doesn't recognize it as a return.

Here's what happened with the person who's set up works ok now.
He'd login, say "Y"es for line-feeds on the login screen and then when we'd chat, my RETs would come out as 2, and his would come out as the ^M character. I logged him in again and he said "n"o for l/f's. It works perfect now. His RETs show up correctly, and mine aren't doubled. The thing is, with other IBM users, if they select "n"o for l/f's, every line overwrites the previous on. Ie: if it were displaying this:

this is a test
my name is bill
i am 16
wow cool
bye

it would come out like this
bye coolis bill

understand?? Also, I am using Oasis' term. mode to call this BBS and every line begins with a ^J (right-triangle graphics character)

Soo.... is there any way that the IBMers can fix this, so I don't have to dig in and replace the RS232 handler I'm using? (which I happen to like and have the least trouble with) or what??? Thanks in advnc
SySOPhBill

I'm working on it, it's not easy, because I'm not a wizard in C yet, and
I have to work from the szrz source code, but I'm getting there. I
might have it done sometime this summer, but it's anyone's guess,
because I'll be in summer school then, and hopefully I'll have a job.
That will cut down on the time I have available to work on it.

I've done a lot of jerking around with the joysticks. You can hack a joystick cable into an RS232 (sorta) cable that'll let you use the R: drivers for the old MPP modems. I did it more as a request for some people that asked 'cause I do have a P:R: so I didn't do it too "pretty". You're limited to 300-450 if you use EXPRESS.MPP or one of the R: handlers. I also added a couple of quick & dirty ONE WAY transfers. You can go to 19,200 BAUD 8-bit to recieving RS232 or 1200 BAUD to the 8-bit. The 8-bit recieve @ 1200 just stuffs data into a buffer via a USR() & returns to BASIC when the START key is press so you can save the data to disk; someone wanted a way to get the R: handlers transferred from their clone to the 8-bit so it's short enough to type in. BTW: I've seen the Atari serial cable to clone & it is elegant! The MAX232 chip alone cost about $6, but the results are great. Much better solution then anything I've ever done with a joystick. At higher BAUDs you just have to shut off the screen & disable interupts to get the timing rightso it's completly useless for any thing you need to look at the screen with. There's enough lines there that you could do handshakes so you could support things like DOS RUN/INIT vectors from the joystick/RS232, but it'd never be as good as the ATARI2PC.

1601. Help on Memory Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-13 01:36:29 UTC
From: chase@electron.rutgers.edu
Message-ID: <Apr.12.21.36.28.1992.22058@electron.rutgers.edu>
Source record: 111645

I recently got a second 130xe and decided to try to upgrade the
memory on the first one. I desoldered the upper 8 64k drams and replaced
them with sockets. I then replaced the chips to check my work. I
wrote a short program to test the memory and discovered a problem that
I could use help tracking down.

Using BANKS = 4, SIZE = 256, BASE =16384, PAGES = 64
and addressing upper memory via.
POKE 54017, 193+4*BANK
loc = BASE+page*SIZE+byte)

And checking if POKE loc,0 and 255 => PEEK(loc) = 0 and 255
respectively I
find a problem with byte = 221 on most pages.

Specifically on BANKS 0, 2 only pages
0,1,8,16,17,24,25,32,33,40,48,49,56 check out ok.
On banks 1,3 all pages have this problem.

So the natural question is: Which chip / pin is in question?

Another thing? I broke off C114 (accidently) which was only marked
something like 50V Z and 104. I assume this means it is a 104pF (?)
Capacitor though it looked more like a diode. I replaced with a
similar looking but slightly smaller capacitor from a 16K memory
board marked 50V Z and 102. If I'm right there shouldn't be a
discernible difference since most of these components are only 5%
tolerance anyways but if I'm wrong and the 102 and 104 are part
numbers or something then I may have a problem. If anyone knows
something about this please send me email or post to this group. I
really could use the help.

One last question. If I replace the 64k dram with a 256k dram without
doing anything to pin 1, will the atari "see" the 256k dram as a 64k
dram and work accordingly, or is it more complicated than that.

>just rumage around for that old SX handler arc??!
>
The problem here is that Oasis tries to hang up by using the DTR signal, which
the R-verter interface just doesn't have. To hang up with an Rverter you
need to send three plus signs and "ATH". A handler for the 850 or some other
interface won't work with an R-verter (except the SX212, which is essentially
a modem with an R-verter built in.)

>The other major reason I think that the Fast R:Verter from BobTerm should

>[RET] key works properly. On the others, it returns a [^M] character and
>the BBS doesn't recognize it as a return.
>
This has nothing to do with the handler. It's just that when those users
log in, Oasis is set on Atascii mode instead of Ascii. I've never used
Oasis, so I don't know what the command is to set it properly.

Message-ID: <1992Apr13.074339.6178@sactoh0.sac.ca.us>
Source record: 111648

The 825 printer is a 40 column printer. Actually, if you have ever seen the printer section to department store terminals from TRW (May Company, some Nordstrom stores), it is the same thing. Not really recommended, unless you printouts that are the same width as department store receipts. Or unless you collect Atari stuff.

OOOPS! That is the 820 printer, sorry.
The 825 is the original Centronics parallel printer. Unless you have an 850, you can not use it with an 8 bit. It's a bit slow. And big, too. Heck, if you can find an SMM801 printer (or the 8 bit XMM801) you'd be better off. The 825 is an 80 column printer, by the way.

1607. COMPLETE 1200XL SYSTEM FOR SALE!!!

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-13 17:02:47 UTC
From: x90hornbach1@gw.wmich.edu
Message-ID: <1992Apr13.120247.3807@gw.wmich.edu>
Source record: 111651

I'm looking to unload my old atari system. Here is what I have:

*1200XL computer (with basic cartridge)

*1050 disk drive

*atari printer (I forget the model, 8 something I think. Dot matrix, anyway)

*2- wico command control joysticks. 7 years old but work like new.

*"R-verter" modem interface. This adapter daisy chains to RS-232 and can handle up to 1200bd. (software included)

*100's of disks (MANY games, some other stuff, visicalc, etc. (no docs))

*Book, entitled "Your Atari Computer"

*All required cables and power supplies.

*This system is ideal for anyone who wants to get an inexpensive system for themselves or their kid.

*I want to sell this system complete only.

Price: What I plan on doing is unloading this system and buying a new hard drive for my pc. I'd like to get arount $275- $300 for everything.

That price is negotiable depending on the response I get, so if you are interested please make an offer, as I am going to sell it one way or another. THIS SYSTEM WILL GO TO THE HIGHEST OFFER!

Please reply: X90HORNBACH1@GW.WMICH.EDU
TEL (VOICE): (616)-342-7337 (Kalamazoo Mich)

thanks
John Hornbach

ps: I will pay any shipping costs.

102 = 1000pf = .001 uf
104 = 100000pf = .1 uf

The last digit is the multiplier. Add the # of zeros to the first
two digits.

These are power supply decoupling capacators and most likely
not the cause of your problem.

Message-ID: <9204131630.AA01998@bitsy.cooper.edu>
Source record: 111653

This is a question for all of you technical folks out there:

MAPPING THE ATARI lists location 53279 (aka CONSOL) as the place to check for a function key use (i.e. START SELECT OPTION). Why is this location also responsible for the internal speaker on the Atari 800? If you poke the location, the speaker will pop. Why did the function keys get put in the same location as the speaker in ROM? Was there any special reason for this? Thanks.

Sincerely,
Tony

1610. ATARI CLASSICS CAMPAIGN: LAST WEEK! (Re-send)

Newsgroup: comp.sys.atari.8bit
Date: 1992-04-13 22:11:02 UTC

CC: POEHLAND
Subj: ATARI CLASSICS CAMPAIGN: LAST WEEK!

**************************** ATARI CLASSICS ******************************
**************************** CAMPAIGN UPDATE *****************************

This is the last week of the mail-in campaign effort to get an all-8bit maga-
zine started. The Campaign officially ends Wednesday, April 15, 1992.

Those of you in the USA or in other countries around the world who have
received a Campaign Information Kit, please make sure you fill out the return
card & drop it in the mail as soon as possible.

Due to a mailing snafu in which a shipment of info-kits went from Pennsylvania
to Jeff Mcwilliams in Michigan via Canada & thus arrived a month late, there
are still about 50-60 kits in our distribution pipeline even at this late date.
Obviously these last kits won't reach their intended addresses until after the
April 15 deadline, but the Campaign Committee encourages you to return the card
anyway. Although the printing/shipping of kits to Campaign distributors has
ceased, it will still take the Committee a few weeks to tally returns and
prepare a final report. The report will be released to all public and private
media without restriction, probably around the last week of April or the
beginning of May. Late returns arriving between the official close of the
Campaign on April 15 and the time the final report of the Campaign Committee
is released, will still be counted and included in the final tally.

So..... RETURN YOUR CARD!!! You still have time!!!

If by means of this announcement you are just now finding out about the mail-in
campaign and want to participate, sorry it's now too late. The Campaign has
been operating since January 12, 1992, and the time is upon us to see where
we stand and decide whether an independent 8bit publication is realistically
feasible.

The Campaign Committee welcomed the addition of Dave Blears who has represented
Campaign interests in Australia and distributed info-kits there. Many thanks
for your efforts, Dave!

I don't have a precise tally of returns, but adding recent international
returns to the last report from Jeff McWilliams puts the figure at just over
400. We are getting *close*, people! This is a real nail-biter!

Over the course of the Campaign, a total of 1512 Campaign Information Kits
were printed and shipped to usergroups and distributors, of which all but the
aforementioned 50-60 still in process have been mailed out. This was a serious

effort. The work of the Campaign Committee is drawing to a close.

The final outcome now depends on YOU.

How does one use the serial for i/o? I thot that the j/stick would be
FAR easier for doing el-cheapo hacks... just poke 2 registers to set up
the thing, and then poke/peek the port to send/recv. Simple!

HAAAAAHHHHHHHHAAAAAAAAAAAAAAA!!!!!!!!!!!!!! That IS good!

I'm wondering. Why are GB's still selling with cool things like
the Sega and NEC >color< systems and the AWESOME Atari Lynx >color<
system around?????
Another one of those questions of life.

I have no idea why this is so. (The XL/XE's don't have an internal
speaker, do they?)

One time I was playing around with S.A.M. (Don't Ask Software's software
speech synthesizer) and found you can have it talk out of the internal
speaker. This modification works whether RECITER is loaded or not.

This bit of code will do the trick: (easily ported to assembly)

```
10 FOR X=1 TO 5:READ A:POKE A,31:POKE A+1,208:NEXT X
20 DATA 16909,17061,17068,17108,17115
```

If you want to change it back to normal output, replace the 31 in line 10
with 1, and the 208 with 210.

It sounds surprisingly good.

Technically, that isn't ROM. That location is in the GTIA chip.
>

No, but they use the same memory location for key clicks and beeps. The
output is mixed with the Pokey chip sounds and sent to the TV or monitor.

I used to run Oasis Jnr. a few years ago so I may be able to help here.
To start with your IBM callers can easily turn their line feeds on at
their end and then say 'No' to line feeds on the BBS when they logon.
Next thing, when you ring out on the BBS term you need to hit one of
the keys to go into Ascii mode (or back to Atascii) but I can't remember
which key it is, I think maybe the Select key, try them all anyway!
As for your modem not hanging up, I think unless your modem can do a
AT&D2 command you are always going to have trouble with it not hanging
up. Have you tried an ATH instead of an ATZ when the BBS hangs up? Did
you know that you can get a PD version of Oasis 4.7? It is called Oasis
TD and is available on GEnie (or used to be). It is exactly the same
as 4.7 but without file transfers. Tell me, do you REALLY manage to
fit it all onto one enhanced density disk drive?? Good luck anyway.

Probably an easlier, simpler way (i.e. cheap) is to setup two displays, one being 40 columns, the other 80 columns. Whereas programs see the 40 column display, we'll see 80 columns on screen. Through some means (i.e. hardware and/or software) the contents of 40 column screen is copied to either the left, right, or middle of the 80 column screen.

|> really could use the help.

A capacitor marked 50V Z 104 means 50V (max. voltage) and 100,000pF or .1uF. The code means 1, 0, and four zeroes in picofarads. When you replaced it with a 102, you were using a 1,000pF (or .001uF) cap, which is 1/100th the capacitance. This probably won't work well at all, but then I don't know what C114 does...
